EDUCATIONAL FORUM 3

CASE BASED APPROACH IN THE MANAGEMENT OF LOW VOLUME INTERMEDIATE RISK PROSTATE CANCER

PANEL MEMBERS

DR. SAMIR TANEJA, PROFESSOR OF UROLOGIC ONCOLOGY NYU

DR. LUKE LAVALLEE, UROLOGIC ONCOLOGIST, UNIVERSITY OF OTTAWA

DR. ERIC VIGNEAULT, RADIATION ONCOLOGIST, UNIVERSITE LAVAL

LAST MINUTE SUBSTITUTION

- Role of Dr Taneja will be played by

- **Dr Joe Chin**

OUTLINE

- Case based approach
- Brief presentation from each panel member
- Meant to be very interactive

OBJECTIVES

- Role of Active Surveillance in Intermediate Grade Prostate Cancer
- Focal Therapy and its use in Intermediate Risk Prostate Cancer
- When to use newer radiotherapy modalities in Prostate Cancer

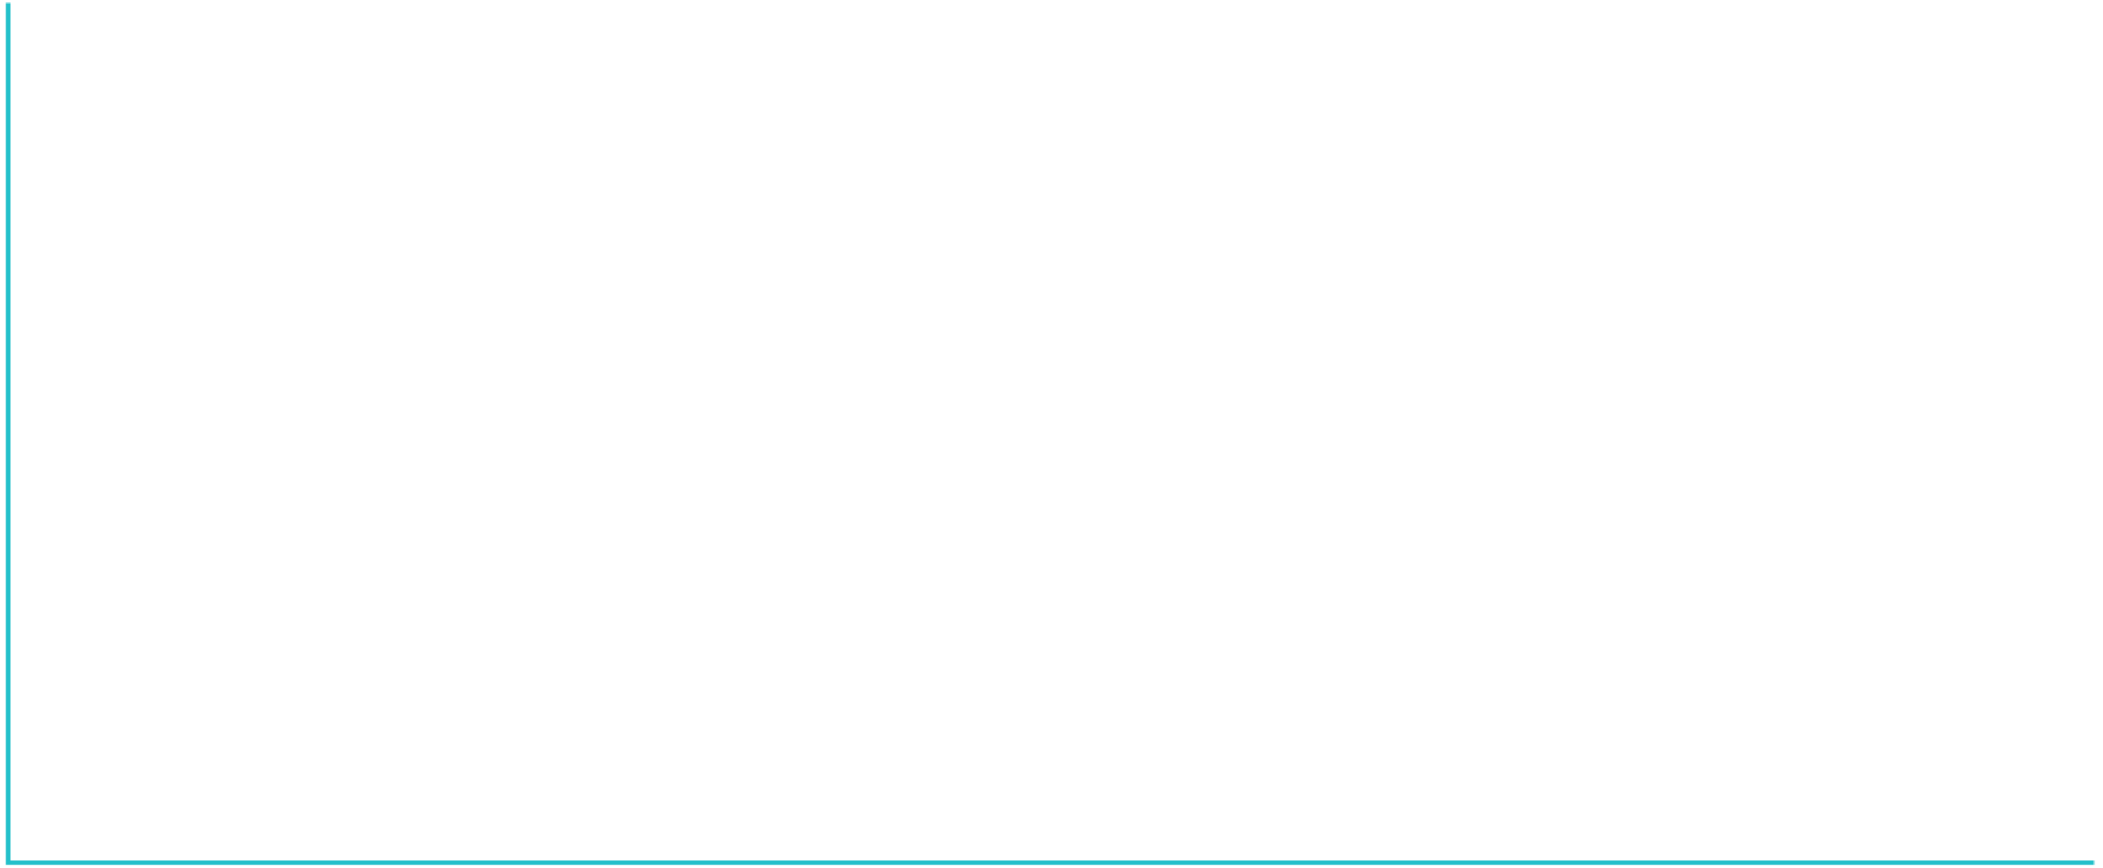
CASE 1

- 52 yo male who presents with PSA 4.2, which is the same on repeat 1 week later. Clinically benign exam but family history of PCa. Takes an antihypertensive and a lipid lowering agent. History bilateral laparoscopic hernia repair.

1. What is Your Next Step?

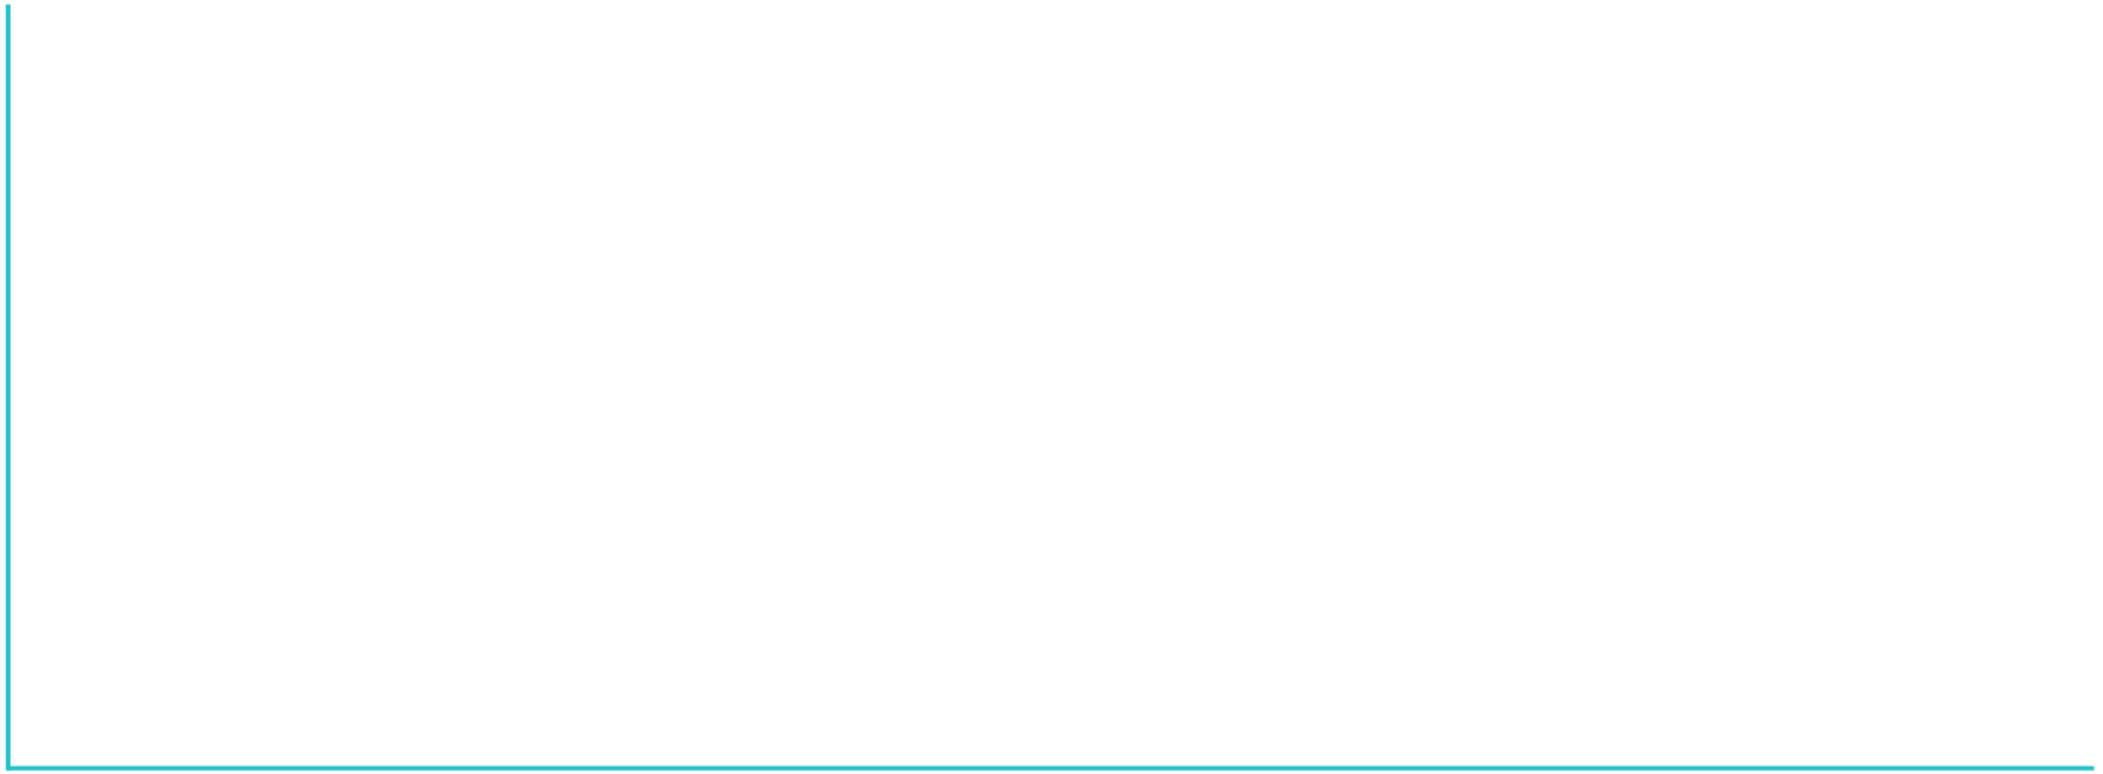
- Urinalysis and Culture
- Repeat PSA in a few months
- Prostate MRI
- Prostate Biopsy

1. What is Your Next Step?



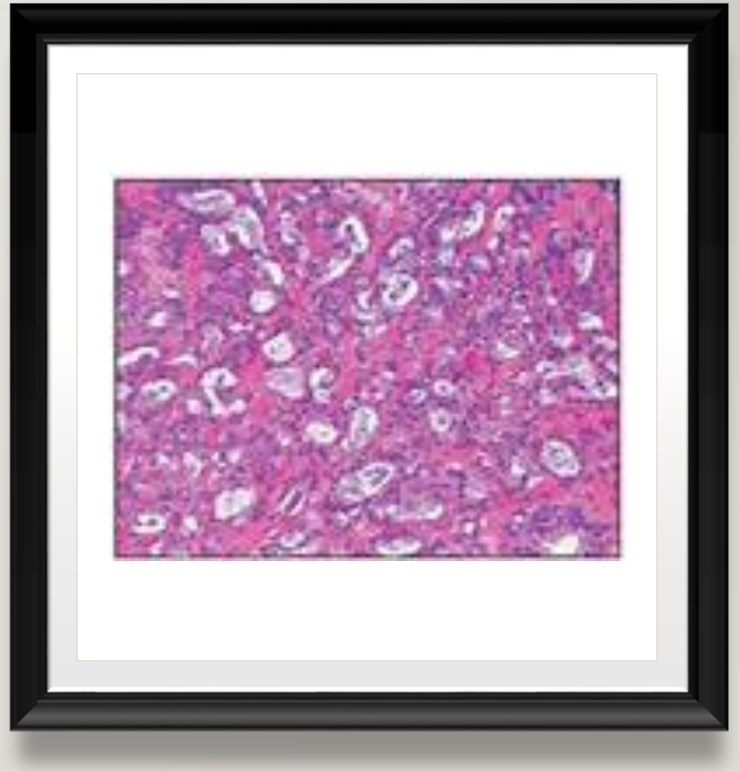
1. What is Your Next Step?

Poll locked. Responses not accepted.



CASE 1

- Elects to undergo Prostate Biopsy. It comes back showing 1/12 cores Gleason GG 2. He has excellent pre op potency and continence with no LUTS.



2. What is Your Next Step?

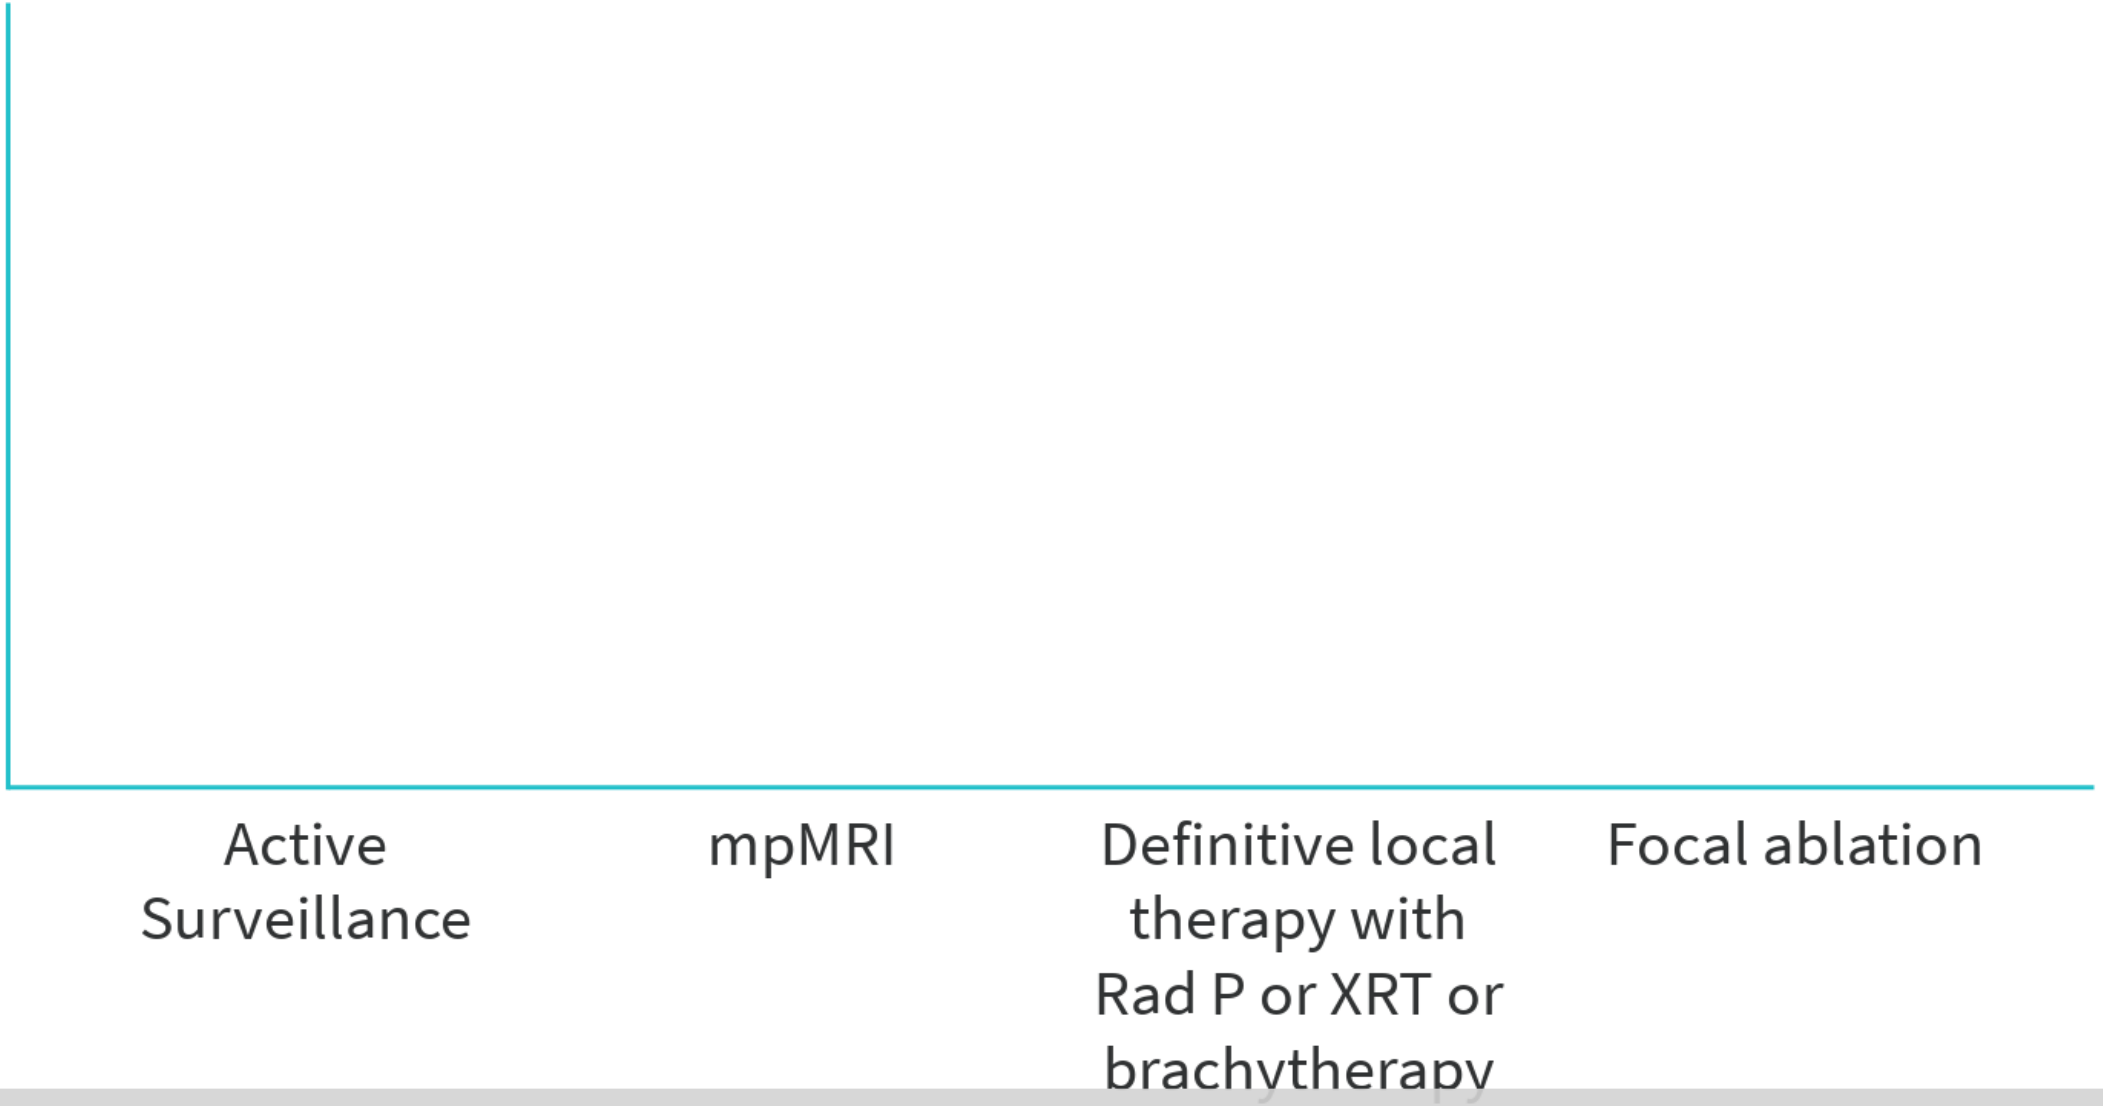
Active Surveillance

mpMRI

Definitive local therapy with
Rad P or XRT or brachytherapy

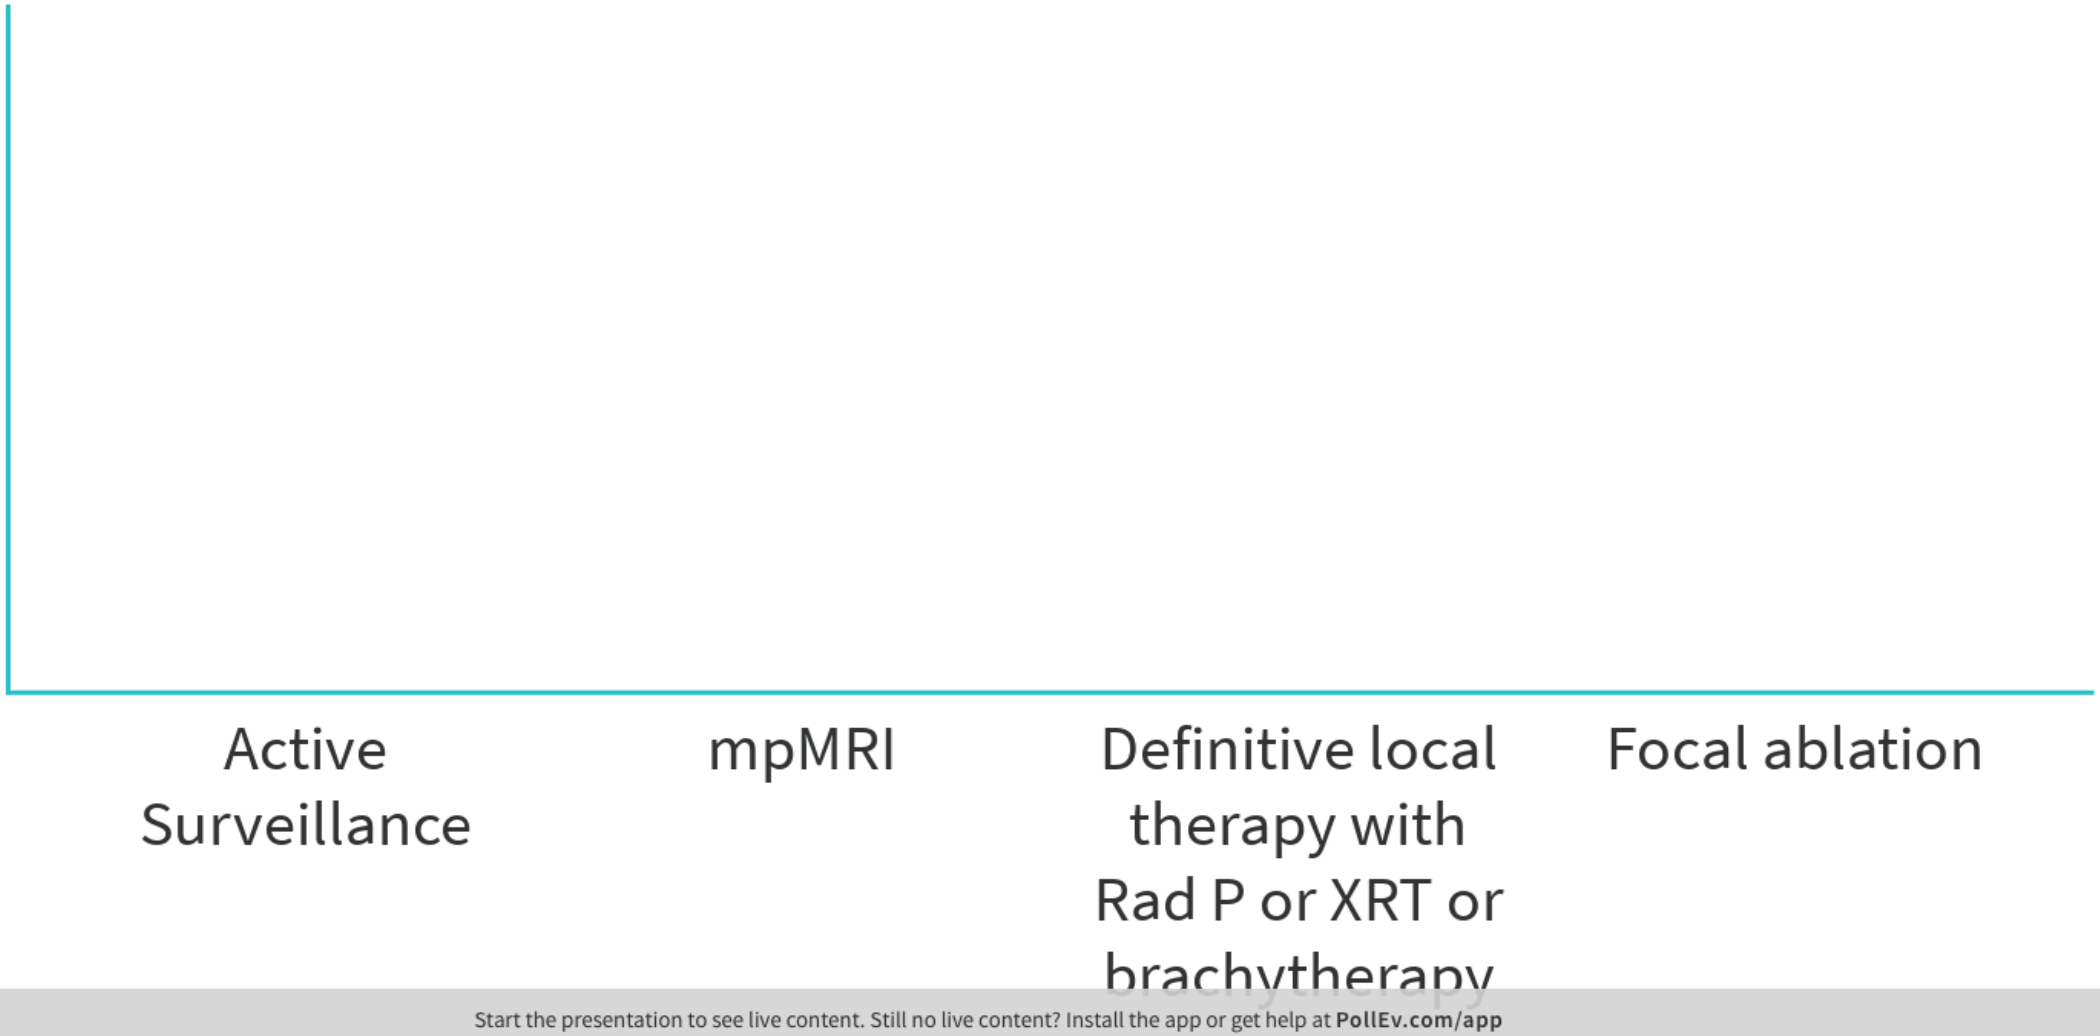
Focal ablation

2. What is Your Next Step?



2. What is Your Next Step?

Poll locked. Responses not accepted.



ACTIVE SURVEILLANCE

Active surveillance for intermediate risk prostate cancer

Luke T. Lavallée
Urologic Oncologist
Associate Scientist
Ottawa Hospital Research Institute
The University of Ottawa

Disclosures

- No financial related to this talk
- Ad boards/grants Sanofi, Janssen
- Perform robotic prostatectomy

Index patient

- 52M
- PSA 4.2
- 1/12 core + Gleason 7

Question:

1. AS
2. MRI
3. RP or XRT
4. Ablation

????

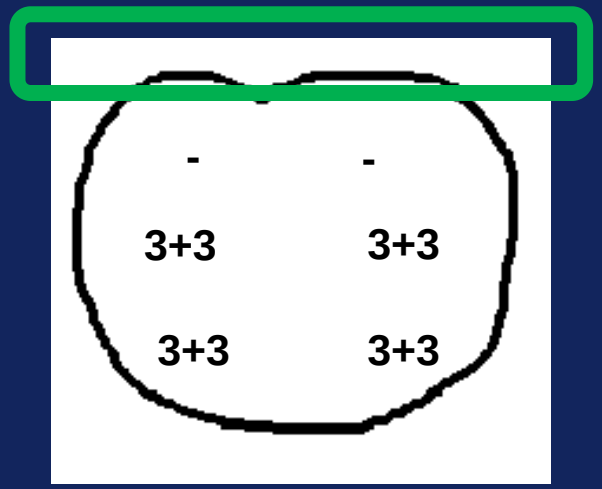
TRADITIONAL GLEASON SCORE	NEW GRADING SYSTEM GROUP 1
GLEASON 3+3=6 Only individual discrete well-formed glands	GRADE 1
GLEASON 3+4=7 Predominantly well-formed glands with a lesser component of poorly-formed/fused/cribiform glands.	GRADE 2
GLEASON 4+3=7 Predominantly poorly-formed/ fused/cribriform glands with a lesser component of well-formed glands.	GRADE 3
GLEASON 4+4=8 Only poorly-formed/fused/cribriform glands or -Predominantly well-formed glands with a lesser component lacking or -Predominantly lacking glands with a lesser component of well-formed glands.	GRADE 4
GLEASON 9-10 Lacks gland formation (or with necrosis) with or without poorly-formed/fused/cribriform gland.	GRADE 5

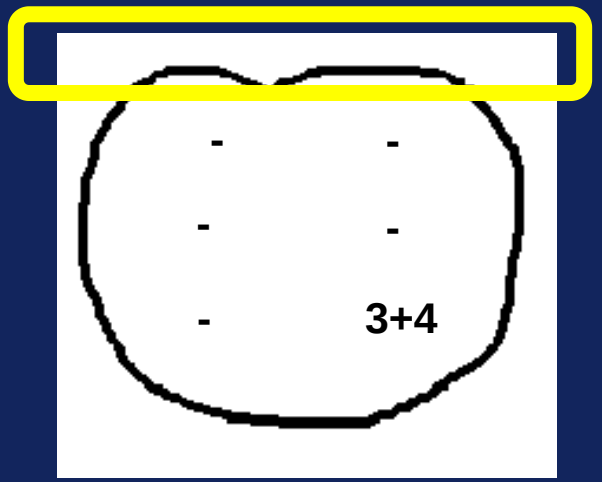
Definition of intermediate risk

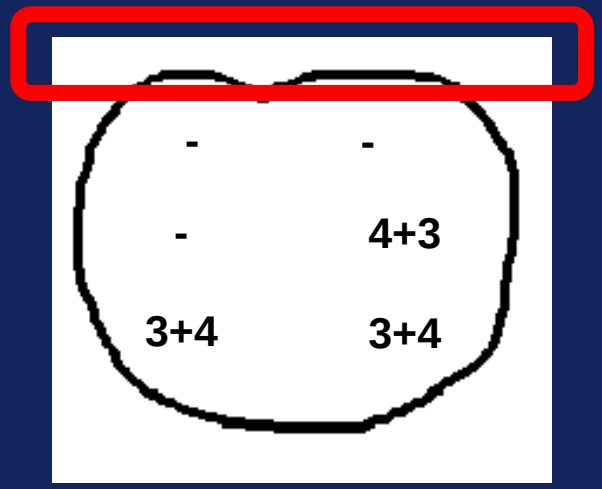
- Intermediate = heterogenous population
  - PSA, stage, Gleason grade / grade group

- Today: Intermediate risk focused on Gleason 7 (3+4 / GG2)

- Surveillance preferred for most Gleason 6







Goals of Active Surveillance

- Maintain quality of life
- Avoid risks of radical intervention
- Identify worse pathology (misclassified or progress)
- Don’t miss window of curability

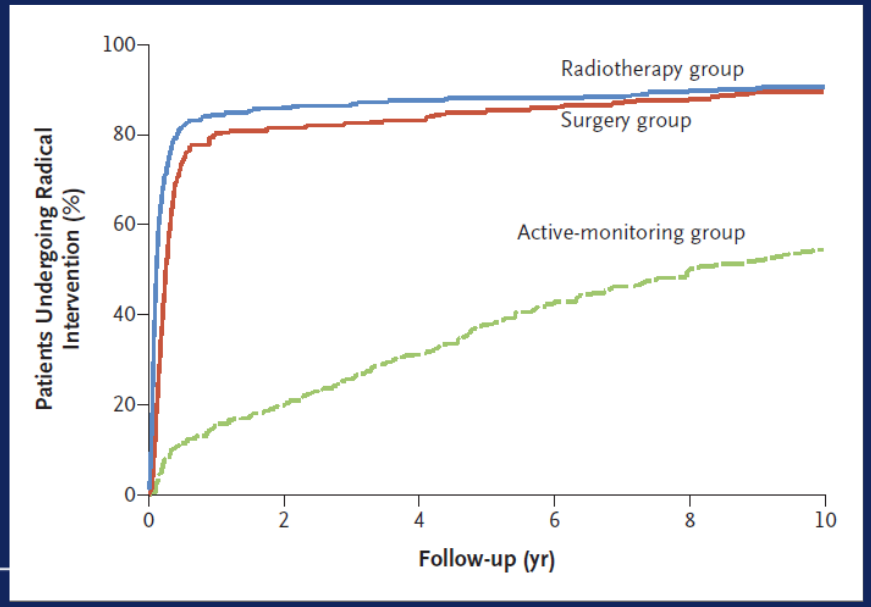
Outcomes Gleason 7 Surveillance

ProTect trial (Hamdy 2016)

- Level 1 evidence

- AS vs RP vs XRT (AS monitoring less intense)
  - n = ~550 per arm
  - 54% of AS had intervention

- PCa survival >98% at 10yrs



Gleason 7 in ProTect

- n = 111 Gleason 7 in AS (20%)
  - Stratified data not reported

- 2-3x increased mets and progression in AS group
  - 6.3 vs 2.4 mets / 1000 person years (low event rate)

Gleason 7 on Surveillance
Cohort studies

- Sunnybrook series (Klotz JCO 2015)
  - n=993
  - 132 (13%) Gleason 7
  - 28 (2.8%) developed mets
    - 16/861 (1.8%) Gleason 6
    - 12/132 (9.1%) Gleason 7
  - Mean time to mets 7.3 years

Intermediate risk and AS

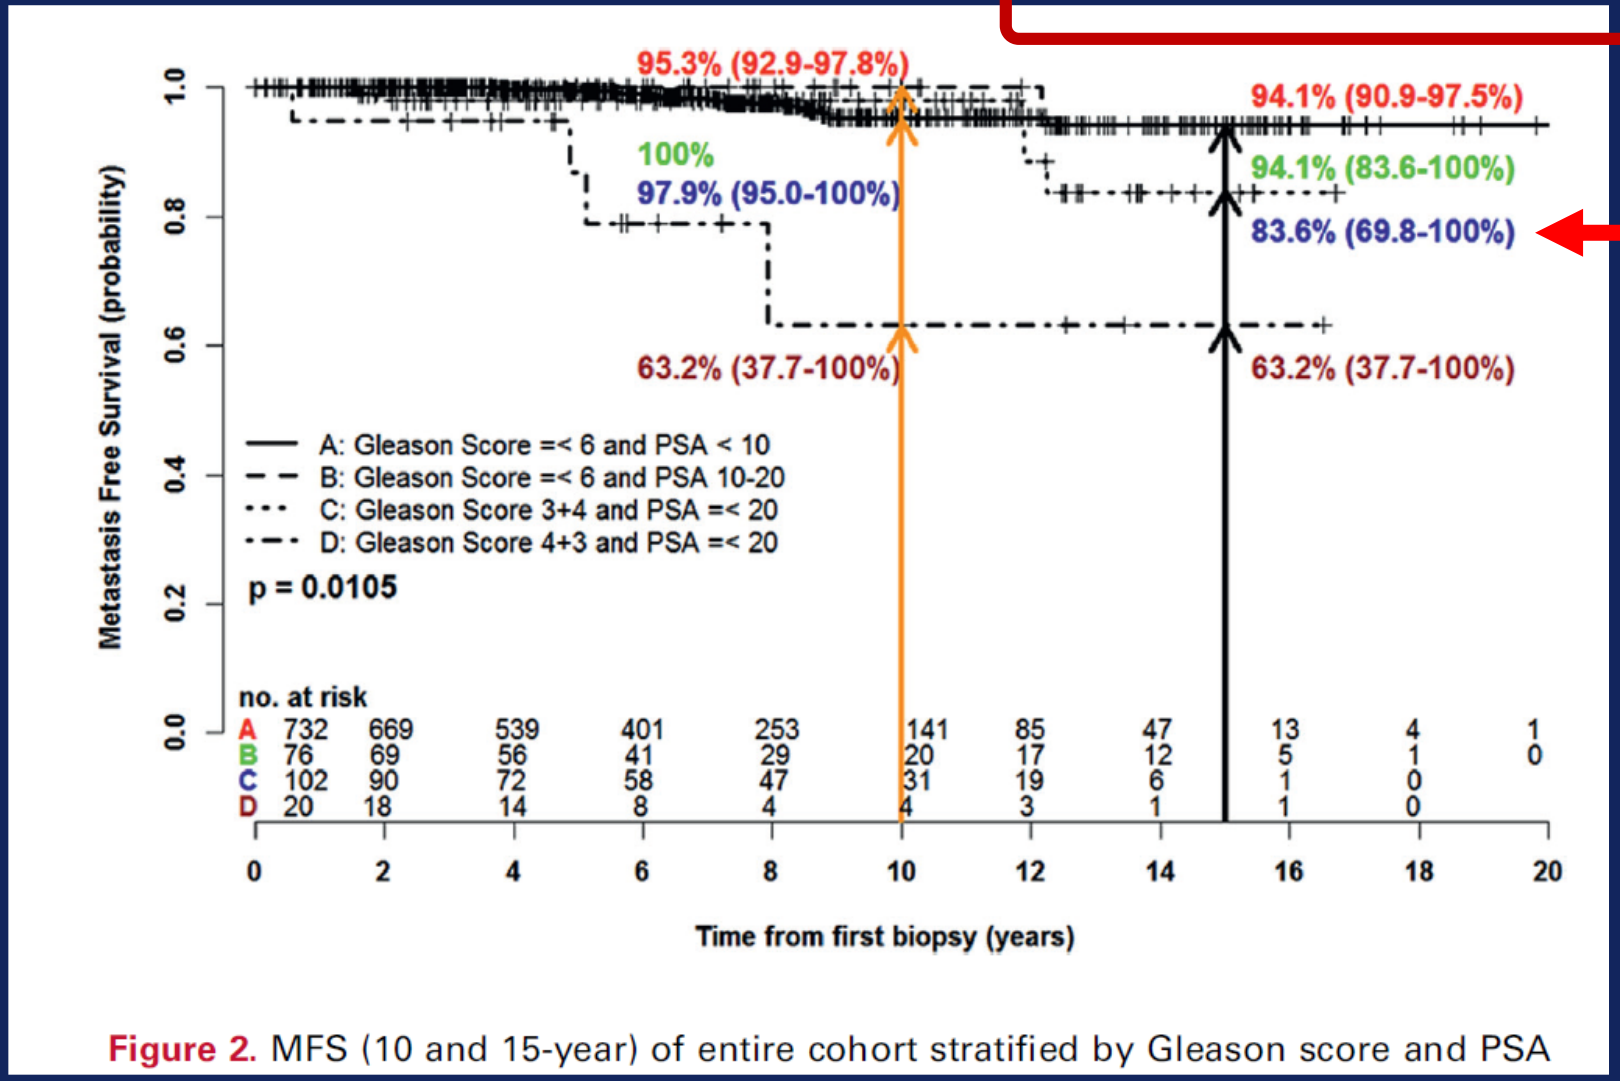


Figure 2. MFS (10 and 15-year) of entire cohort stratified by Gleason score and PSA

Surveillance for intermediate risk

- Conclusions
  - Mets more common
  - Change btwn 10 and 15 year f/u

Questions remain

1. Will longer f/u show worse outcomes in AS?

2. Selection bias to enter studies, trigger treatment?
   - Where these patients followed/treated the way we would treat a healthy Gleason 7 on AS?

3. Could MRI/biomarkers help select/monitor?

Cancer Care Ontario Guideline

- CUAJ Morash et al. 2015

> **RECOMMENDATION 2:** Active treatment (RP or RT) is appropriate for patients with intermediate-risk (Gleason score 7) localized prostate cancer. For select patients with low-volume Gleason 3+4=7 localized prostate cancer, AS can be considered.

- <10% pattern 4
  - Assumes 12 core biopsy/standardized reporting

NICE Guideline (UK 2019)

1.3.12 For people with intermediate-risk localised prostate cancer:

- offer radical prostatectomy or radical radiotherapy **and**
- consider active surveillance (in line with recommendation 1.3.9) for people who choose not to have immediate radical treatment.

How to perform AS in Gleason 7

- PSA – trend more than number
- DRE
- MRI – early if not done before biopsy
- Repeat biopsy early
- Genomic testing, biomarkers??
  - I do not use at this time

NICE 2019 – AS protocol

Table 4 Protocol for active surveillance

Timing	Tests[†]
Year 1 of active surveillance	Every 3 to 4 months: measure prostate-specific antigen (PSA)[‡] Throughout active surveillance: monitor PSA kinetics[§] At 12 months: digital rectal examination (DRE)[¶] At 12 to 18 months: multiparametric MRI
Year 2 and every year thereafter until active surveillance ends	Every 6 months: measure PSA[‡] Throughout active surveillance: monitor PSA kinetics[§] Every 12 months: DRE[¶]

[†]If there is concern about clinical or PSA changes at any time during active surveillance, reassess with multiparametric MRI and/or re-biopsy. [‡]Could be carried out in primary care if there are agreed shared-care protocols and recall systems. [§]Could include PSA density and velocity. [¶]Should be performed by a healthcare professional with expertise and confidence in performing DRE. In a large UK trial that informed this protocol, DREs were carried out by a urologist or a nurse specialist.

Eligibility Criteria - Key concept

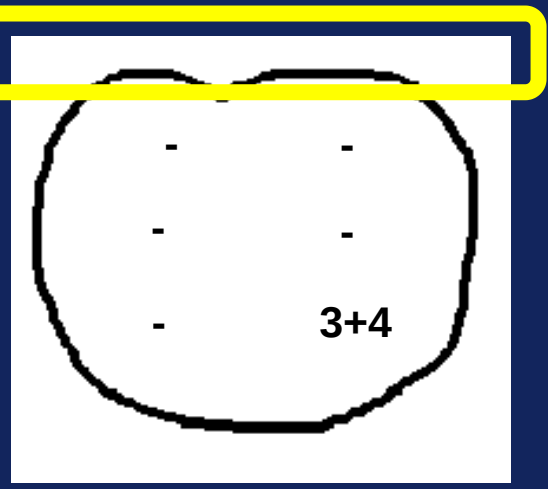
- Eligibility criteria represent a spectrum of risk

  - Restrictive criteria → less progress to treatment
  - Inclusive criteria → more progress to treatment

Match intensity to patient/disease characteristics

Take Home Messages

- Surveillance is standard for Gleason 6



- Gleason 7
  - Short term outcomes good
  - Long term, higher risk mets

- My opinion:
  - Period of surveillance acceptable for some Gleason 7
  - Need research to:
    - Define eligible patients
    - Determine best monitoring plan

Thank you

- Luke Lavallée
- lulavallee@toh.ca

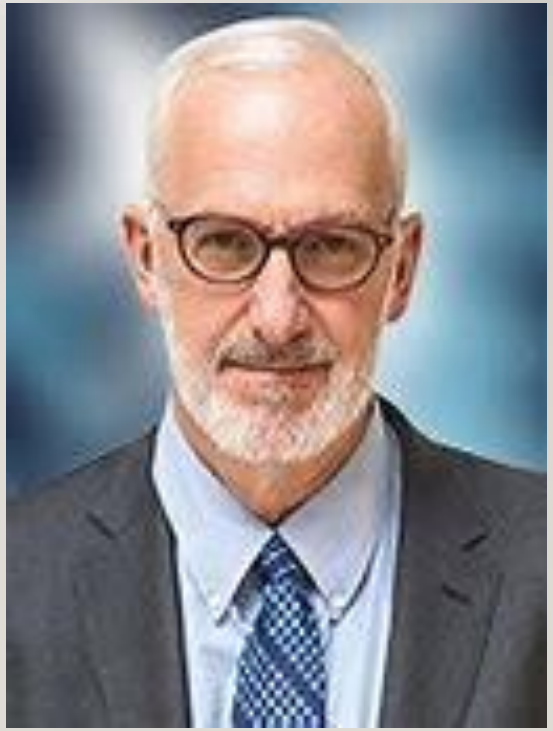
Institut de recherche de l'Hôpital d'Ottawa

SURVEILLANCE TAKE AWAYS

CASE 2

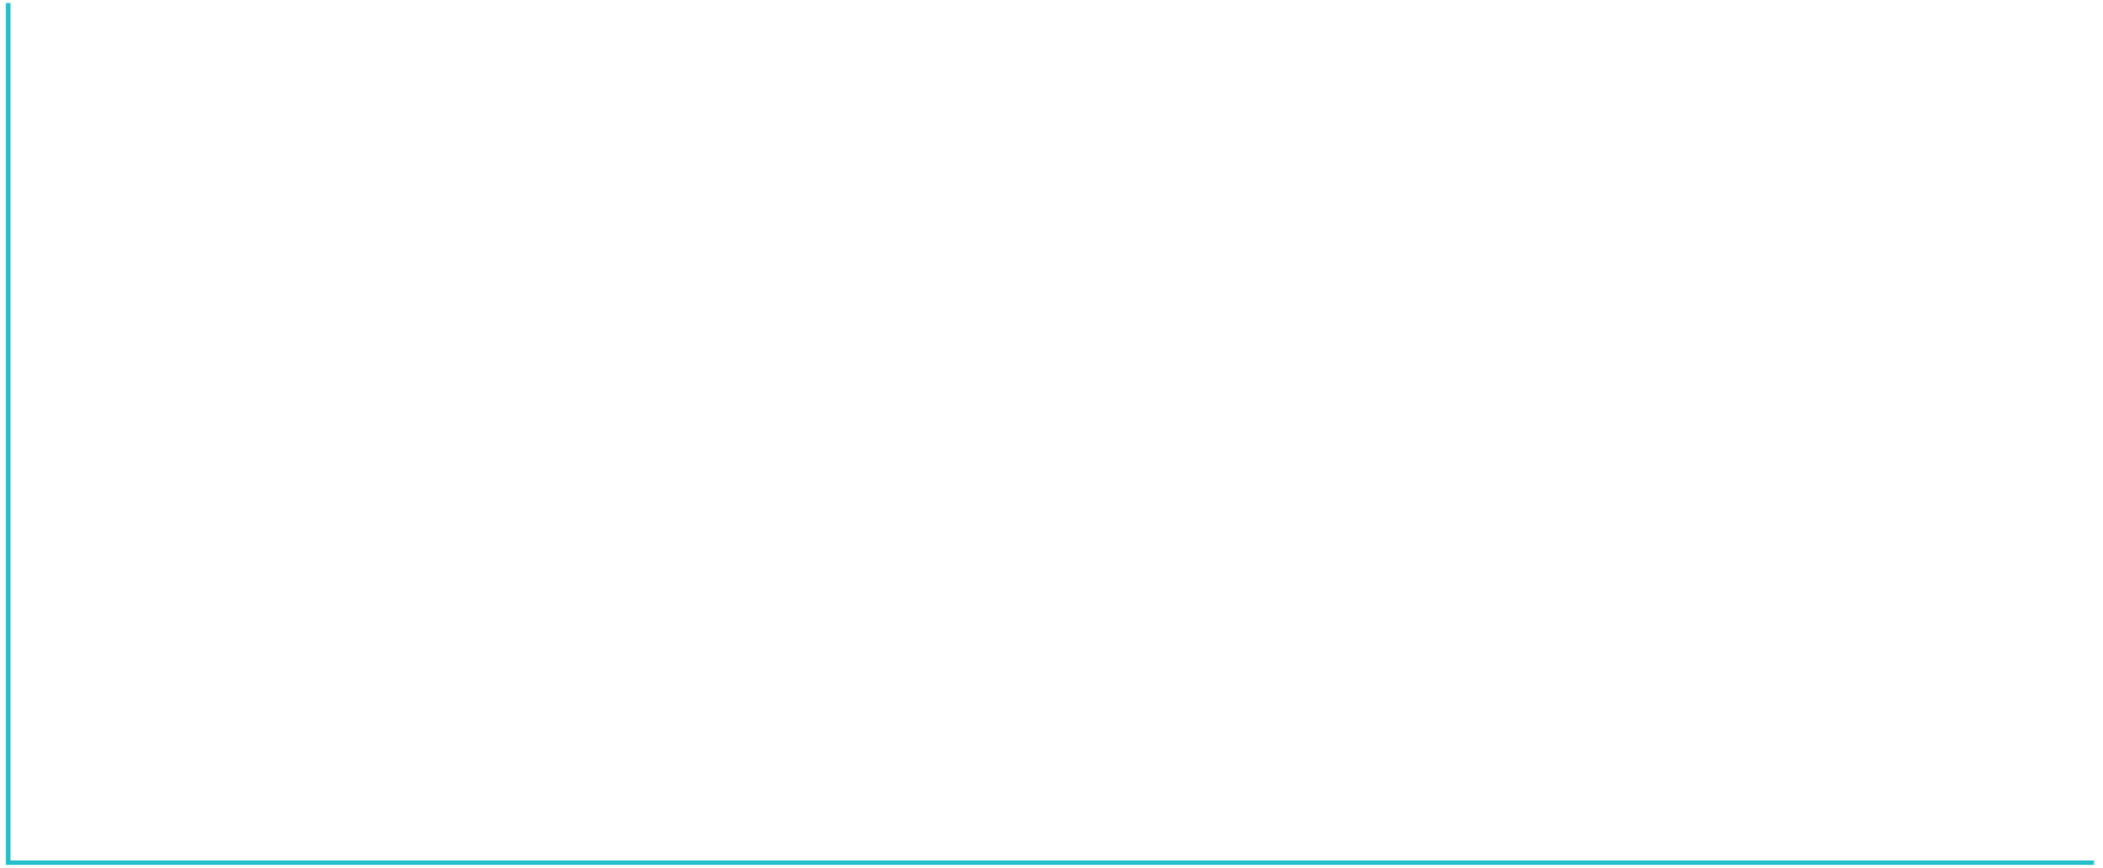
- 67 yo male referred with PSA 8, DRE reveals a benign feeling prostate of about 40cc. Minimal LUTS, has HTN and hypercholesterolemia, previous appendectomy. Last year his PSA was 4.
- He elects to undergo a prostate Biopsy and it shows 3/12 cores positive with most of the cores showing 10-15% volume. Gleason Grade Group 1.



3. What is Your Next Step?

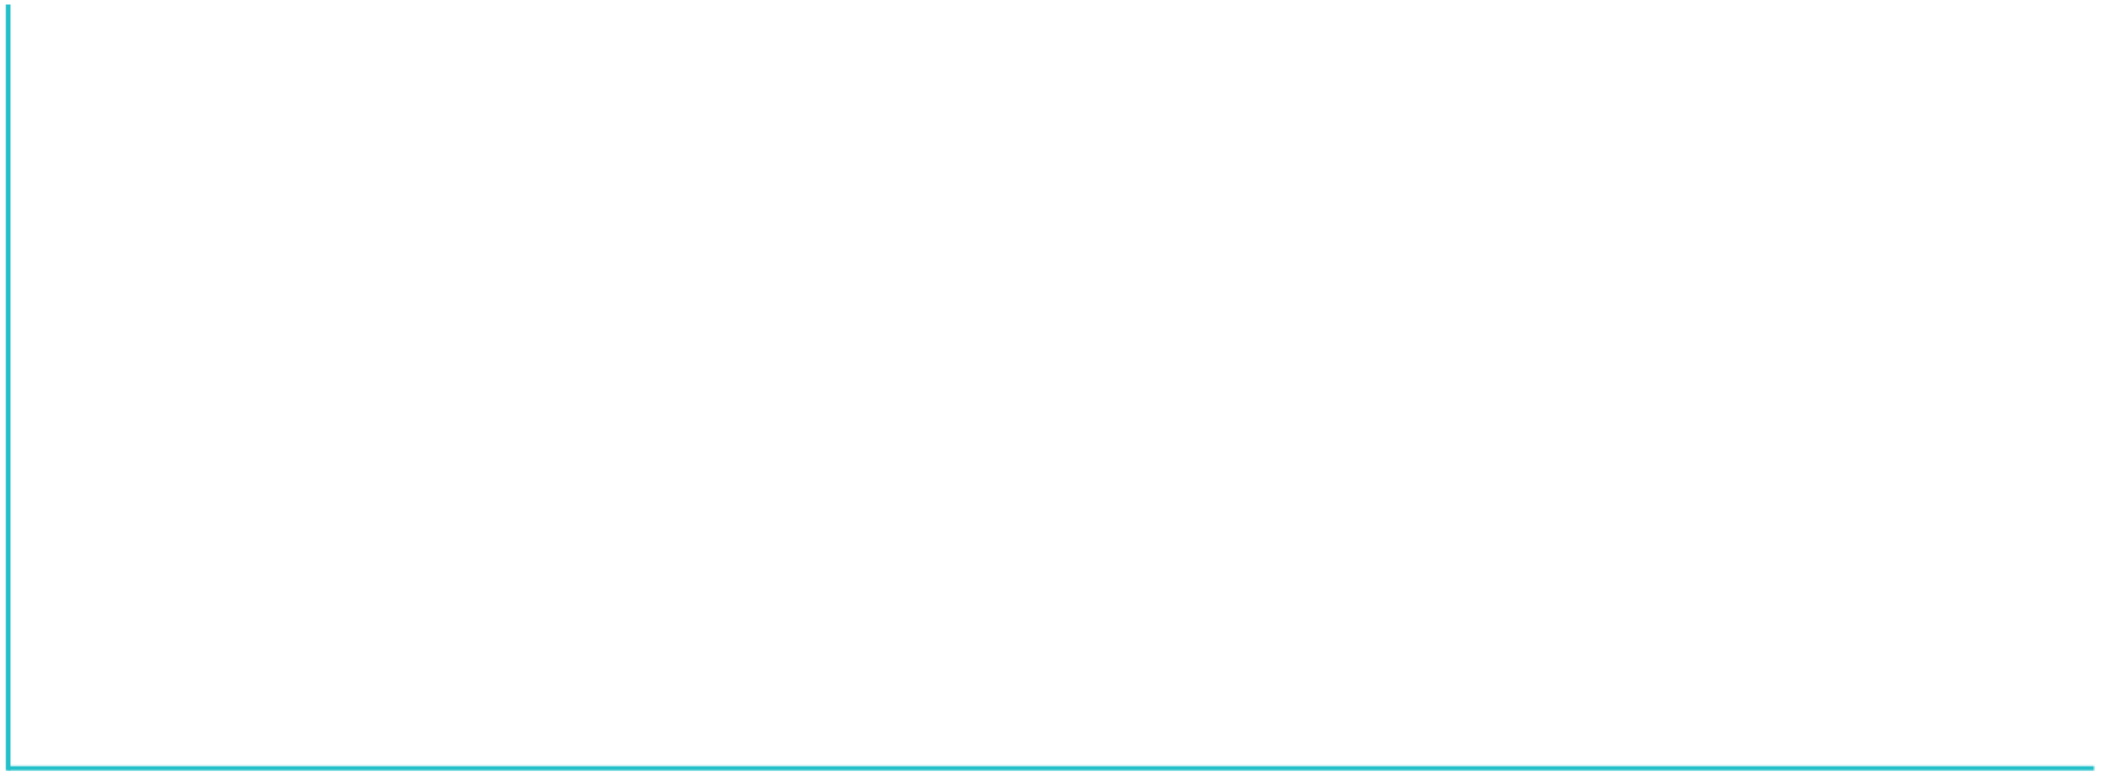
- Initiate Active surveillance
- mpMRI prostate
- Arrange for definitive Treatment
- Arrange CT scan and Bone scan

3. What is Your Next Step?



3. What is Your Next Step?

Poll locked. Responses not accepted.



CASE 2

- On confirmatory Biopsy it shows 3/12 cores + with one core showing GG2 with 70% of that core positive and the remaining GG1

4. What is Your Next Step?

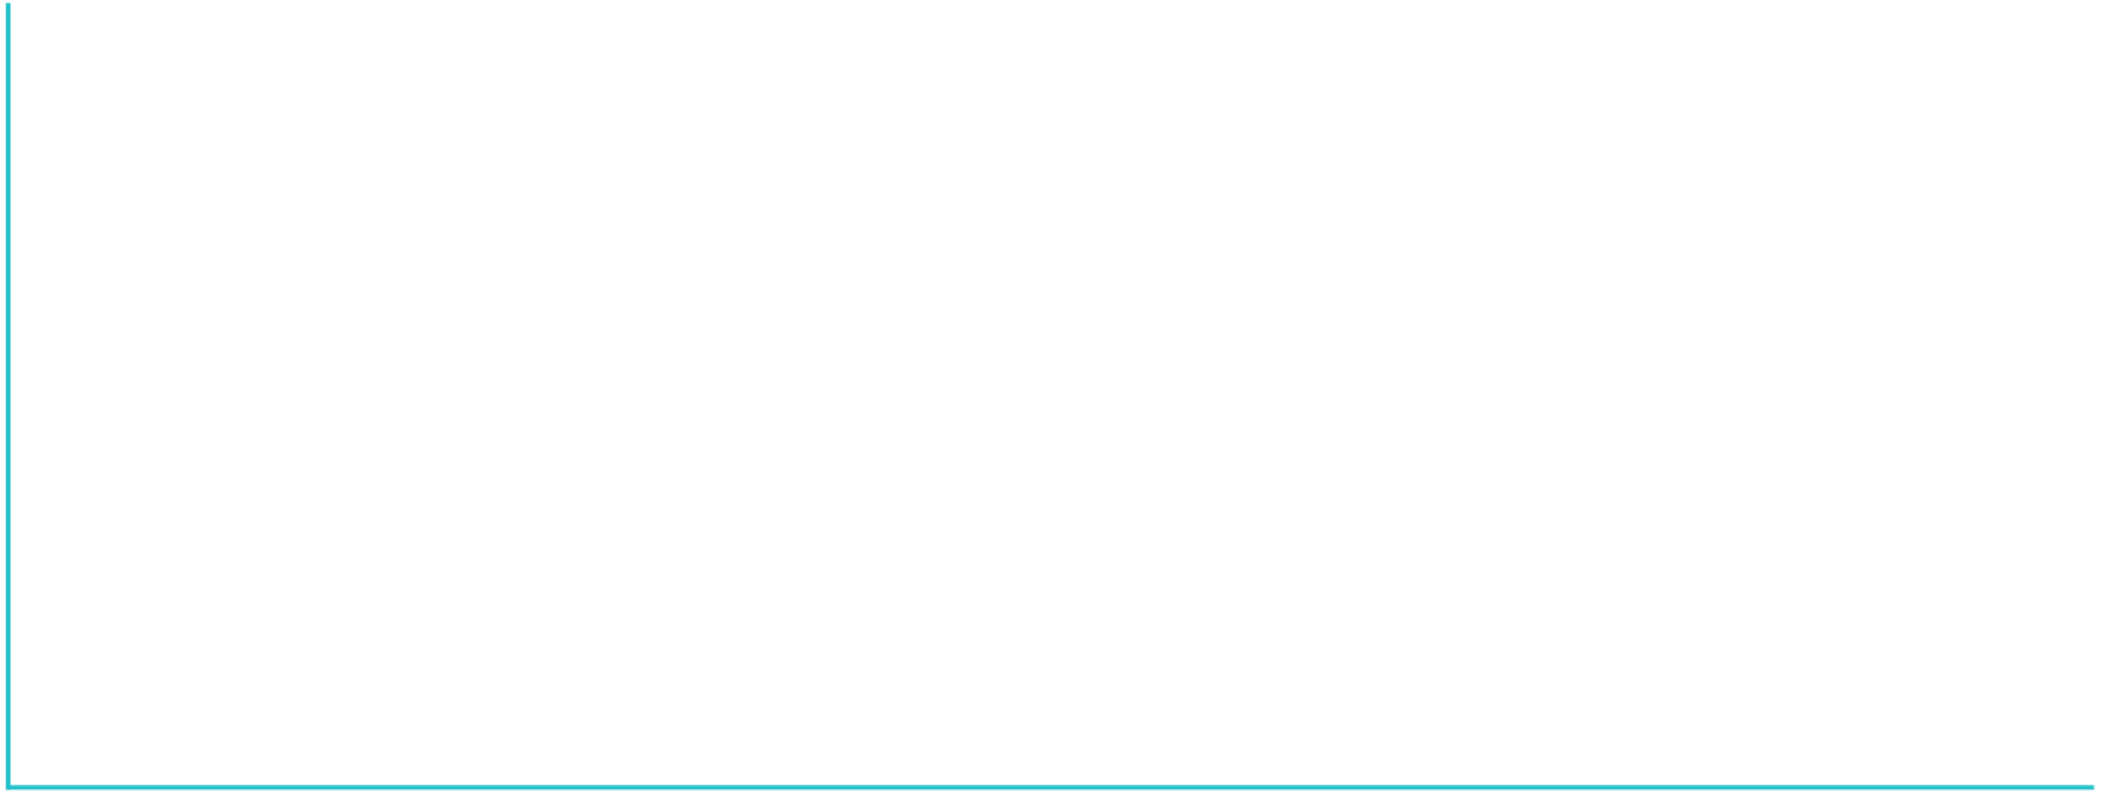
Continue Active surveillance

MRI prostate

Arrange for definitive Tx with focal therapy

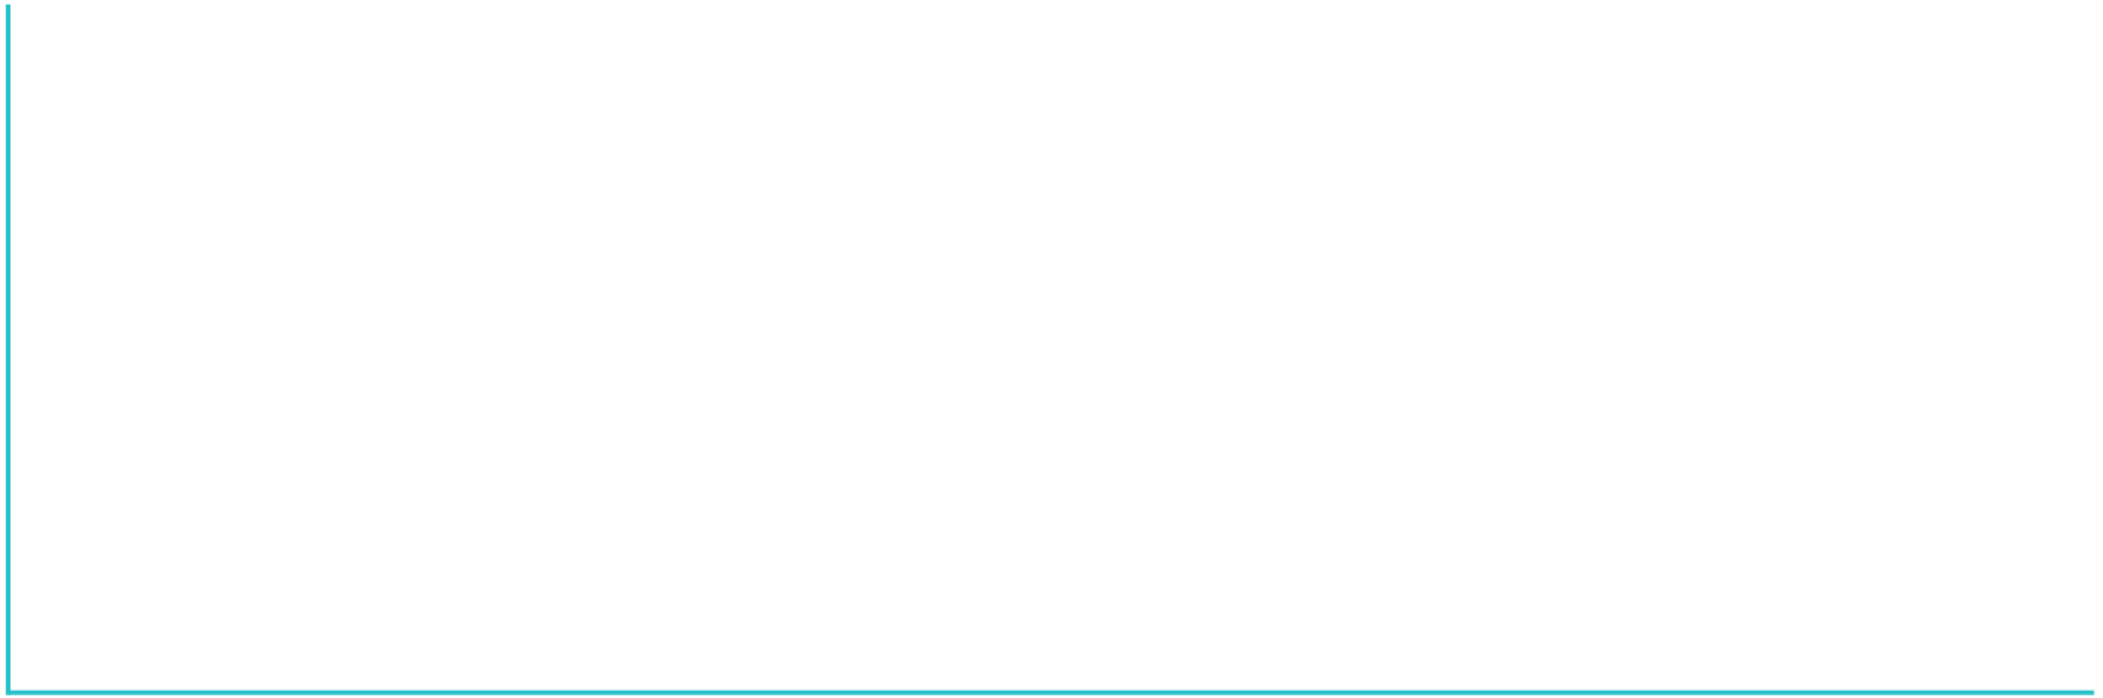
Arrange for definitive Tx with XRT or
Radical Prostatectomy

4. What is Your Next Step?



4. What is Your Next Step?

Poll locked. Responses not accepted.



FOCAL THERAPY

IMPLEMENTATION OF FOCAL THERAPY IN PRACTICE :CRITICAL CONCEPTS AND OBSTACLES

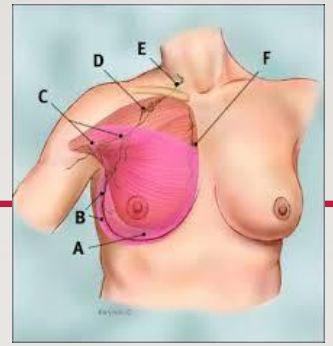
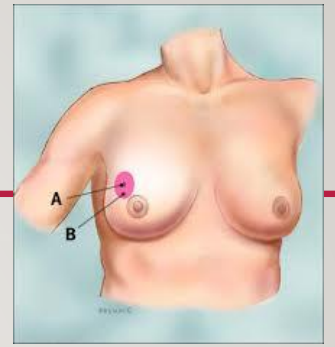
THERAPY FOR PROSTATE CANCER IS A CONCEPT, NOT A TECHNIQUE

Or …IS IT?

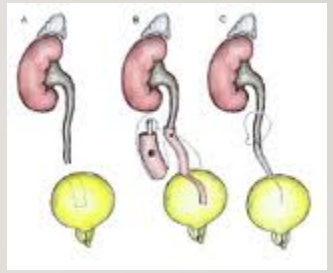
LESSONS FROM OTHER ORGAN SITES

- Breast

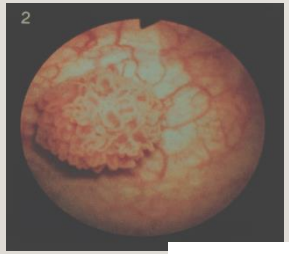


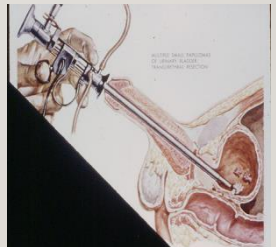


- Urothelial

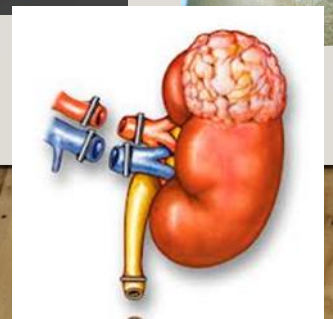


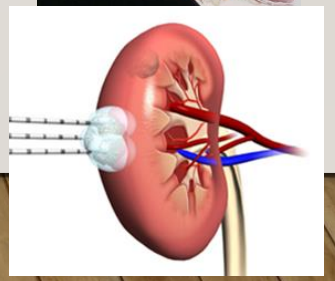
Low Risk Bladder



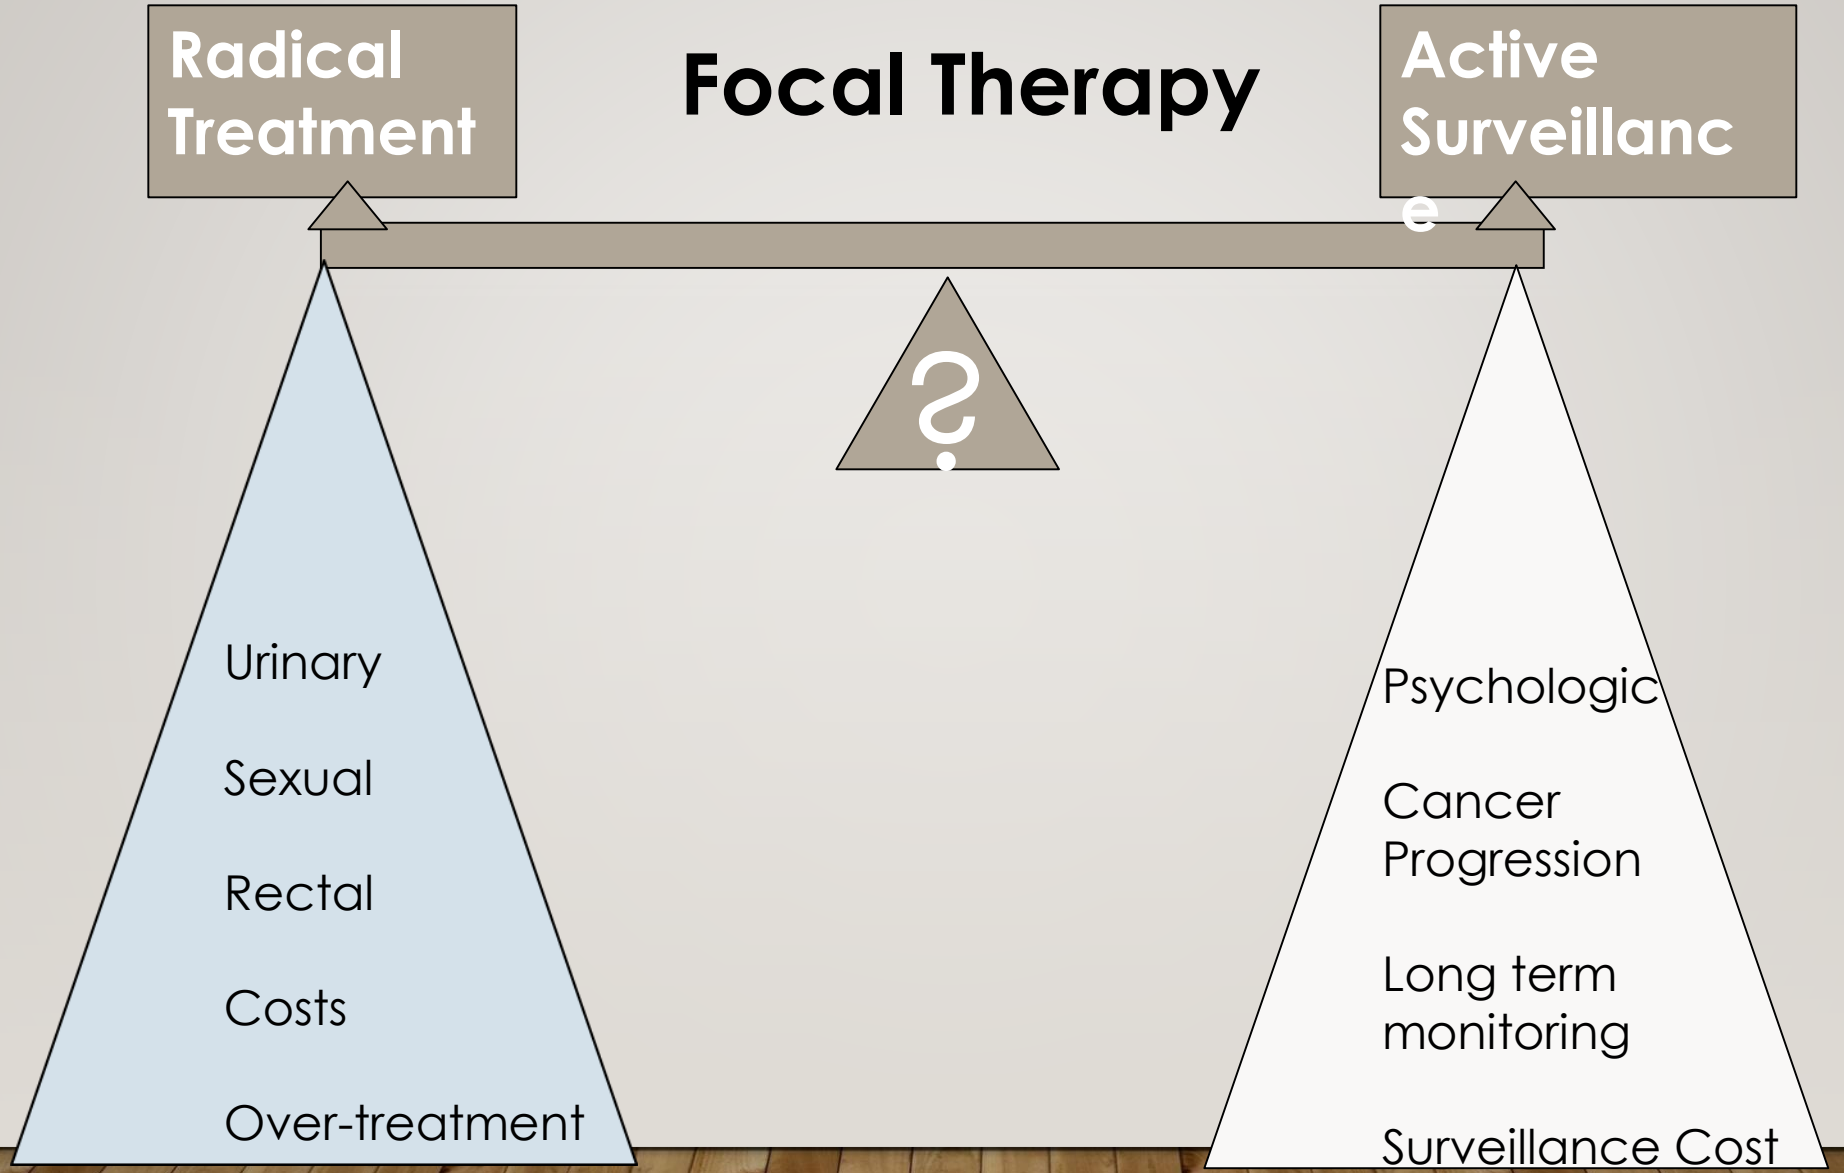


Renal





Options for Localised "Focal " Prostate Cancer

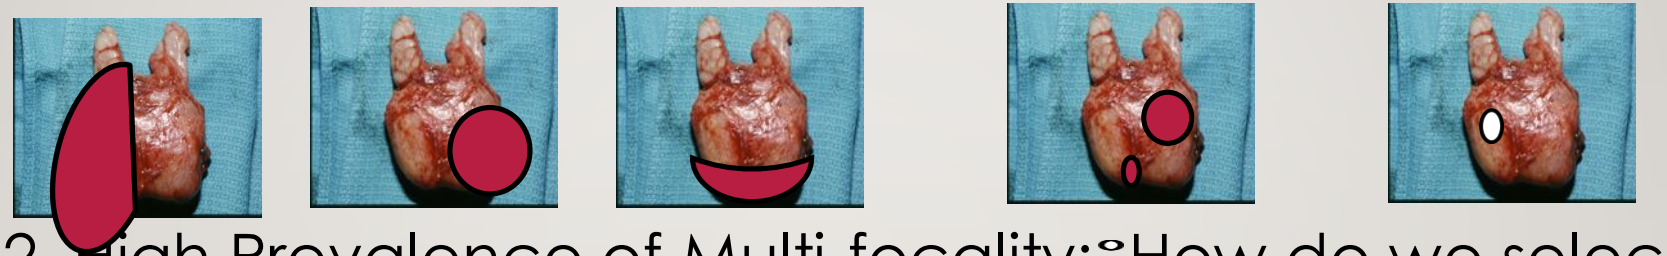


CRITICAL CONCEPTS YOU MUST ACCEPT TO ADOPT FOCAL THERAPEUTIC APPROACHES

- **Therapeutic goal is distinct from conventional therapy**
  - **high likelihood of residual cancer foci (>50%)**
  - **goal is prevention of metastasis/mortality**
  - **may allow reduced intensity of follow-up as compared to active surveillance**
- **Maximal treatment incorporates biopsy/MRI/3d conceptualization of tumor**
- **Follow-up may be inaccurate**
  - **relies on biopsy sampling efficiency/ image detection**
  - **PSA not as useful as in radical therapy**
- **The approach is investigational**
  - **no long term outcomes**
  - **No consensus on definitions of success**

CHALLENGES & TYPICAL CRITICISMS OF FOCAL THERAPY

- 1. Defining "Focal Ablation" Therapy
  - *Hemi-. Quadrant ab., Zonal ab., Index lesion ab.. ? "True Focal"*



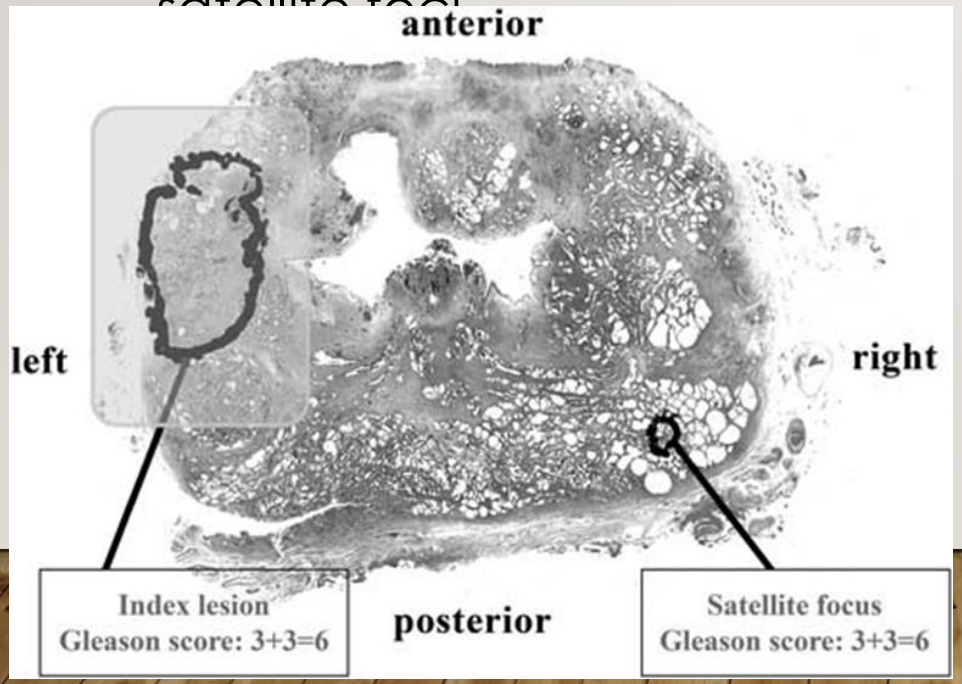
- 2. High Prevalence of Multi-focality: How do we select the right candidates?
  - → *"Index Lesion Hypothesis"*
- 3. Imaging, Biopsy & Access Challenges: accurate localization, sampling & targeting
  - → *Advanced Adjunctive Imaging and Localization Aids*
- 4. Effective Selective Ablation:
- 5. Assessing "Success"

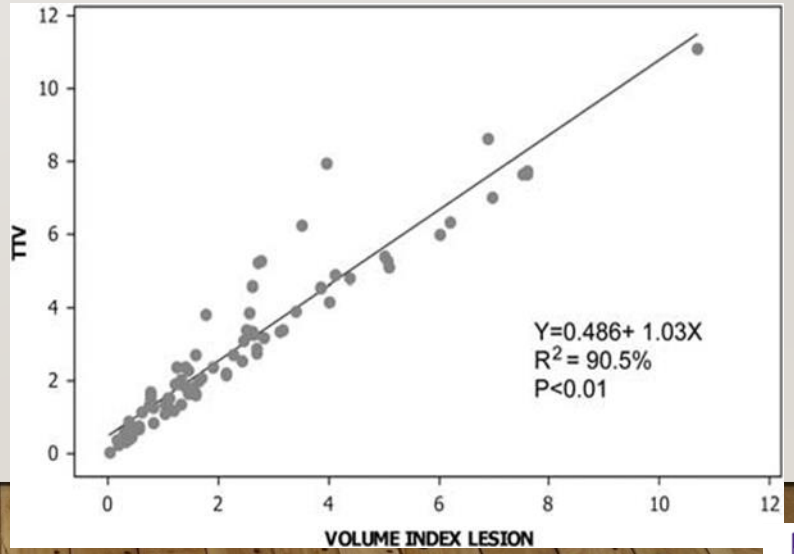
POSSIBLE ANSWER TO MULTIFOCALITY ISSUE "INDEX LESION HYPOTHESIS"

Villers, McNeal, Stamey; Cancer 1992

- ~~Disease progression and Natural History determined by Biology~~ and size of the Index Lesion

- ? Suffices to Ablate Index Lesion and Closely Follow-up smaller satellite foci





Prostate Cancer and Prostatic Diseases (2010), 1–7

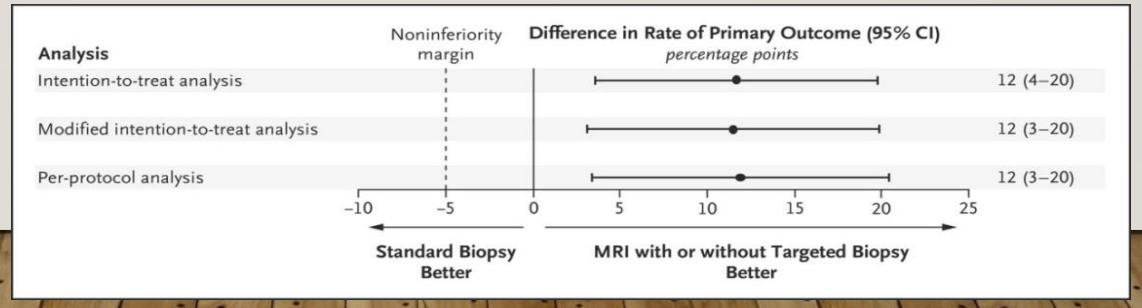
MRI-Targeted or Standard Biopsy for Prostate-Cancer Diagnosis

MR targeting bx results:
- More clinically significant ca
- Fewer clinically insignificant ca
- Max core length higher
- % +ve cores/total cores



KASIVISVANATHAN ET AL. NEJM 2018

CRITICAL DECISIONS IN FOCAL THERAPY IMPLEMENTATION

- **Candidate Selection**
- **Method of Disease Mapping/ Identification**
  - **Biopsy vs Imaging**
- **Choice of Energy**
- **Manner of Follow-up/ Verification of Efficacy**

CANDIDATE SELECTION: DISEASE RISK STRATIFICATION

- **Low risk men**
  - **Usually based upon high disease volume, young age**
  - **Not likely to improve survival relative to surveillance**
  - **Practical benefits of avoiding repetitive surveillance biopsies, cost**

To mitigate uncertainty & anxiety

- **Intermediate risk men**
  - **Usually based upon low disease volume, older age**
  - **In need of treatment**
  - **Long lead time provides reasonable salvageablity**

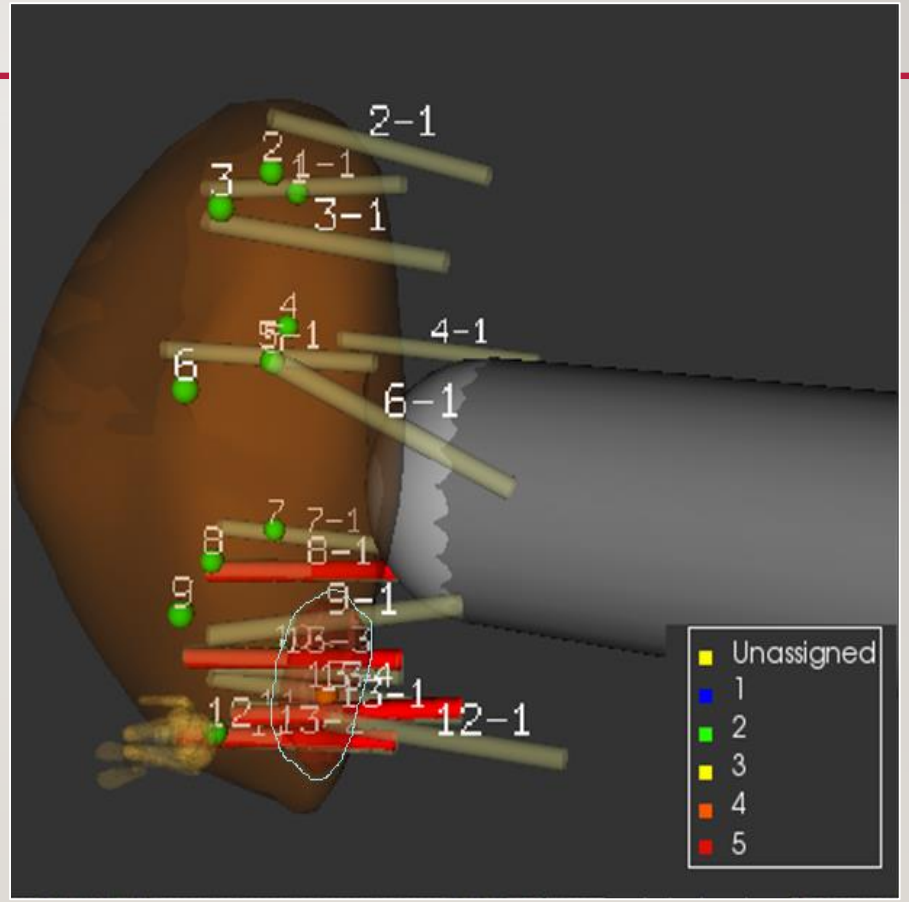
In place of Definitive Whole Gland Ablation
To mitigate/defer adverse effects

- **High risk men**
  - **As monotherapy in low volume disease**
  - **As adjunct to systemic therapy in high volume disease**
  - **Local failure risks loss of 'window of curability'**

Part of multi-modal therapy

CO-REGISTRATION GUIDED FOCAL ABLATION

- Biopsy targeting by fusion and systematic biopsy
  - Concordance of MRI, targeted biopsy, and systematic biopsy
- Ablation with 10 mm intraprostatic margin
- Ablation with 3 mm extraprostatic margin if abutting capsule
- Follow-up co-registered biopsy
  - Fusion using pre and post treatment MRI



CRITICAL DECISIONS IN FOCAL THERAPY IMPLEMENTATION

- Candidate Selection
- Method of Disease Mapping/ Identification
  - Biopsy vs Imaging
- **Choice of Energy**
- Manner of Follow-up/ Verification of Efficacy

AVAILABLE ENERGY SOURCES FOR FOCAL ABLATION

- Laser
- Electroporation
- Radiofrequency (bipolar)
- Photodynamic Therapy
- High-intensity Focused Ultrasc
- Cryosurgery
- Drugs/toxins
- Radiation (focal/interstitial)
- Surgery

Short f/u and small #s
Most are single centre case-series

COMPLICATIONS AND FUNCTIONAL OUTCOMES

Study	Complication	Definition of Continence	Continence	Definition of Potency	Potency
Lian et al 2016	Retention 3.4%	No pad	97.6% at 6 weeks (mild incontinence) 100% at 1 year	Ability to have intercourse	76.9% of those previously potent
Durand et al 2014	Retention 15% Recto-urethral fistula 2% Cavernous corpus necrosis 2% Urethral st 2%	No pad	100%	IIEF	Mild reduction in IIEF at 3 months then back to baseline at 6 months
Barqawi et al 2014	NR	AUA SS	decrease in AUA SS at 24 mo		ge at 24 mo
Hale et al 2013	4% (1 retention needing TURP), 1 UTI 4%	No pad	100%	Need for assistance/ IIEF	73% needed assistance No impotence

Not surprisingly,
Good functional outcome

FORMS OF FAILURE

- Treatment zone failure - RARE
  - Due to incomplete thermal effect
  - Due to non-confluence in treatment zor

Didn't see it
Didn't target properly
Didn't heat/freeze enough
Didn't plan properly

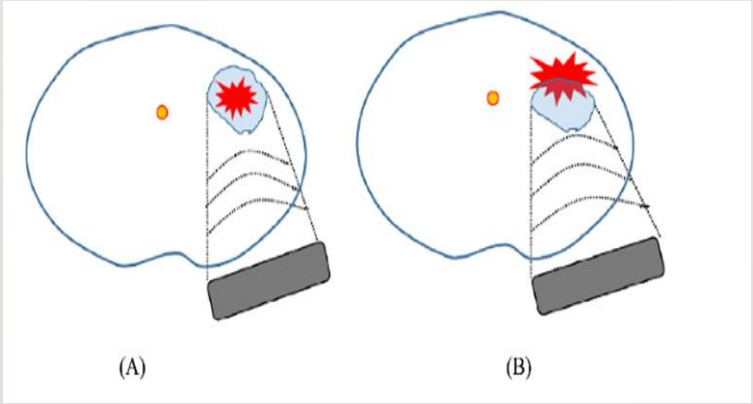
- Margin failure- **MOST COMMON**
  - Inadequate treatment margin
  - Underestimation of tumor size
  - Inadequate thermal effect at margin

- Failure outside the treatment zone – COMMON BUT QUESTIONABLY RELEVANT
  - Poor baseline staging
  - Generally indolent disease

Many Unanswered Questions…..
Still Investigational

Best Imaging? Best Targeting/coupling ? Best Ablative Modality???
Longer term results???
Best follow-up routine???
Salvageabilty??? Strategies???

?



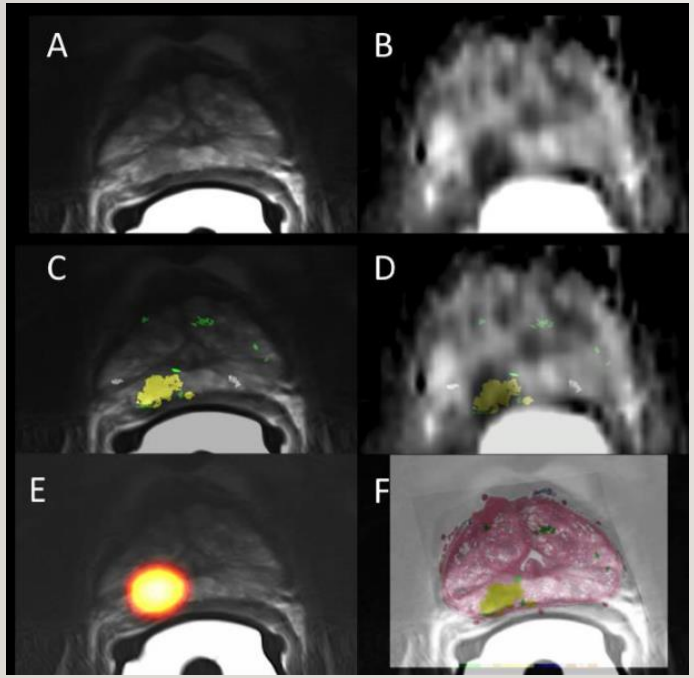
HIFU, Cryo, and Brachy for posterior, anterior, and apical tumors, respectively, to improve the overall outcome???

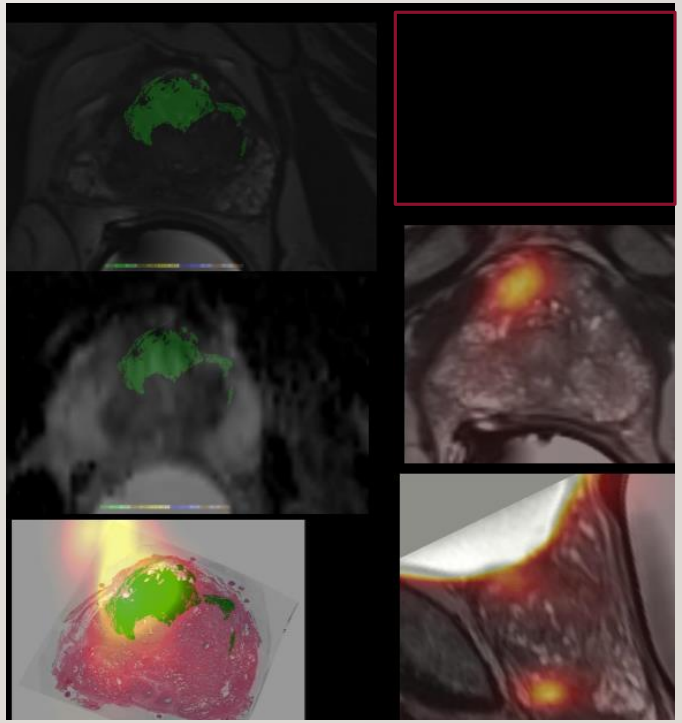
PSMA PET / MRI……PSMA PET / CT
….maybe very useful for Focal Therapy

Eur Urol Focus. 2016 Oct 26. pii: S2405-4569(16)30147-X. doi: 10.1016/j.euf.2016.10.002. [Epub ahead of print]

[18F]-DCFPyL Positron Emission Tomography/Magnetic Resonance Imaging for Localization of Dominant Intraprostatic Foci: First Experience.

Bauman G[1], Martin P[2], Thiessen JD[3], Taylor R[3], Moussa M[4], Gaed M[4], Rachinsky I[3], Kassam Z[5], Chin J[6], Pautler S[6], Lee TY[7], Valliant JF[8], Ward A[9].





WHAT IS NEEDED TO START A FOCAL THERAPY PROGRAM

- A shift of your thinking
- A good team
  - Radiologist
  - Pathologist
  - Data management
  - Care coordination
- Good tools
  - Biopsy tools
  - Imaging
  - Ablation
- A good plan for conduct
  - Biopsy guided
  - Image guided
- A good plan and resources for follow-up
  - Diligence from patients and staff in adherence to follow-up
  - Careful data recording
- QA initiatives to inform and re-define approach

SUMMARY: PROSTATE FOCAL ABLATION

It's here to stay!

- Dominant Lesion theory
- Imaging & Dx: mpMRI essential, ?PET
- Patient Selection: Patient and Tumor factors – Key to good oncological and functional outcome
  - "Best" candidate: Gl.3+4, solitary lesion favorable location & size, good life expectancy
- Metrics:
  - NO standardized defn for BCR,
  - Residual disease needs to be histologically confirmed
  - QOL & functional outcomes req validated instruments

Summary: Prostate Focal Ablation

- Published results to date: No Level 1 Evidence
  - Mostly Cryo and HIFU….variable reporting
  - Good ***SHORT-TERM*** oncologic results & excellent functional outcomes
  - High quality RCT's req'd
- F/U: mpMRI, Bx of treated area Yr. 1, 2 & 5
- PSA & functional assessment q3, then q 6m
- Salvage Strategies
  - individualized according to 1° focal therapy
  - Focal salvage recommended only if causes of initial failure identifiable and rectifiable

Remember: It's still investigational

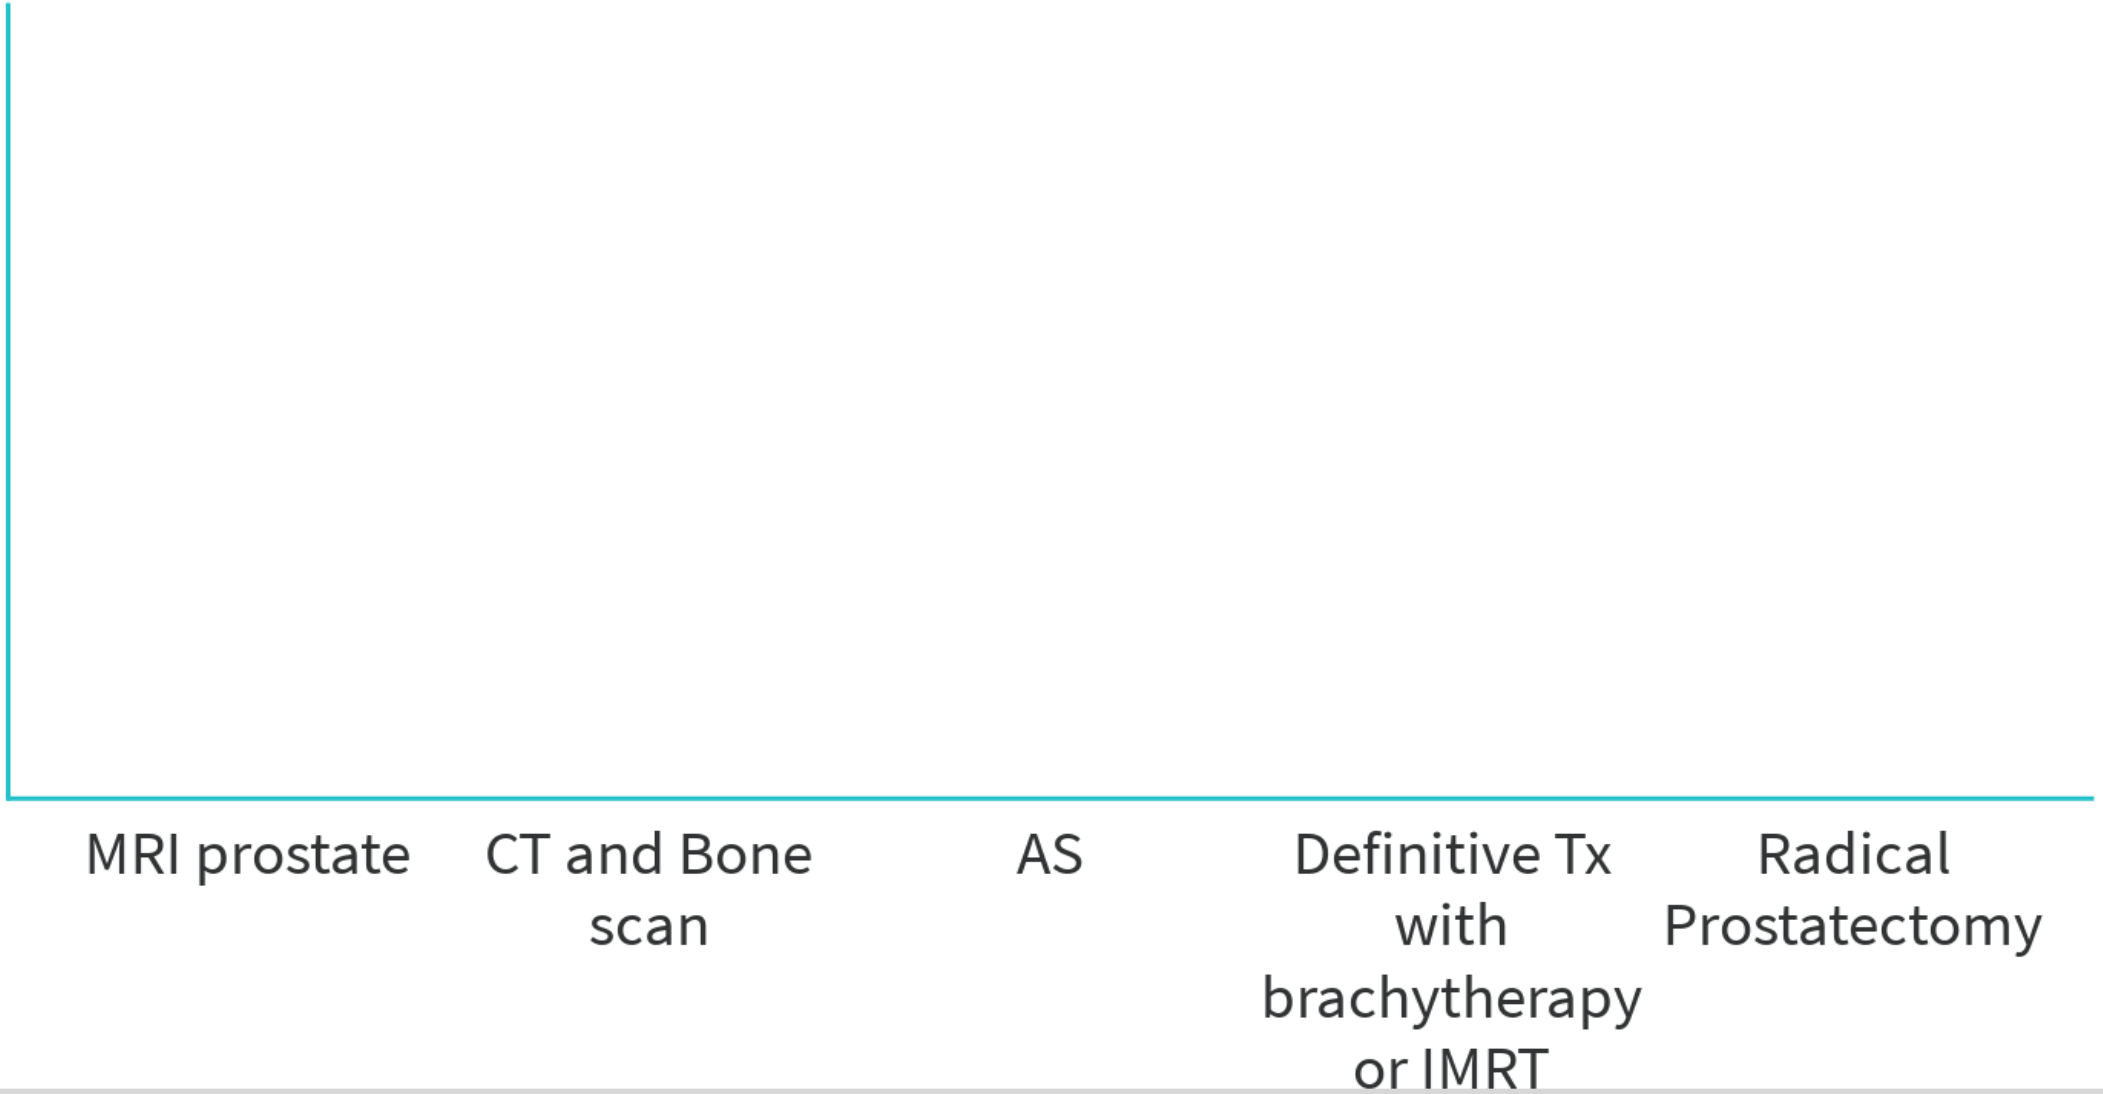
CASE 3

- 65 yo male who has recently been diagnosed with PCa. PSA 6.5 with 4/12 cores with 2 cores showing GG 2, and the others GG1. His past history is significant for GSW to abdomen as a young man and exploratory laparotomy as well as CABG 10 years ago but has good exercise tolerance now. BMI 38.

5. What is Your Next Step?

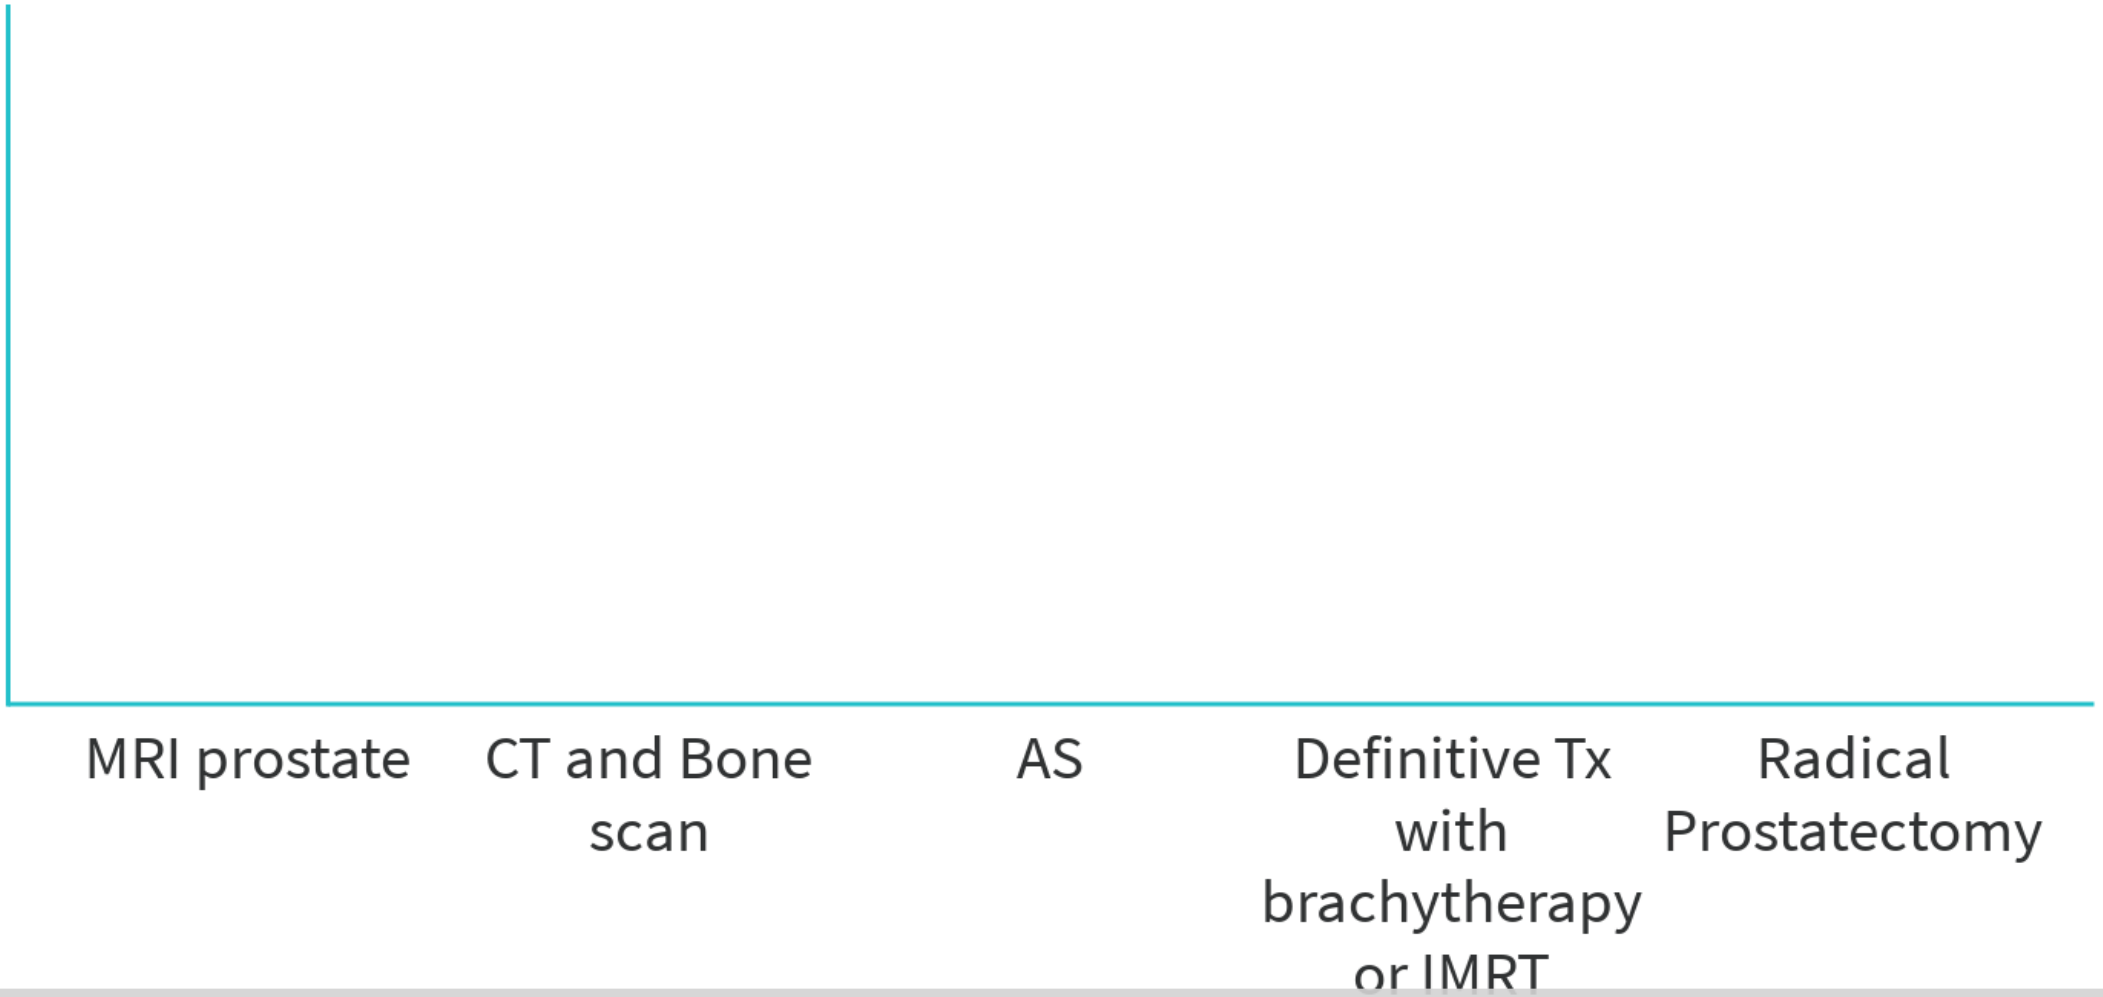
- MRI prostate
- CT and Bone scan
- AS
- Definitive Tx with brachytherapy or IMRT
- Radical Prostatectomy

5. What is Your Next Step?



5. What is Your Next Step?

Poll locked. Responses not accepted.



BRACHYTHERAPY OR STEREOTACTIC RT

Stereotactic Body Radiotherapy (SBRT) vs Brachytherapy in the management of Low Intermediate Risk Prostate Cancer

Eric Vigneault MD,MSc

COI Disclosure

Advisory Board / Speaker

Sanofi	Tersera
Abbvie	Janssen
Ferring	Bayer

Learning Objectives

At the conclusion of this talk the participant will be able to:

1. Describ the impact of technology in prostate cancer radiotherapy
2. Describ the role and evolution of SBRT in prostate cancer
3. Describ the role and evolution of brachytherapy in prostate cancer

Plan

- Introduction
- Progress in treatment technology

SBRT the new kid on the block

SBRT/SABR definition

- Stereotactic Body Radiotherapy = Stereotactic Ablative Radiotherapy
- Precise delivery of very high fractional doses with modern image-guided radiation therapy therapy devices
- To deliver brachytherapy-like doses while sparing adjacent normal tissues
- In order to improve relapses rates and reduced toxicity

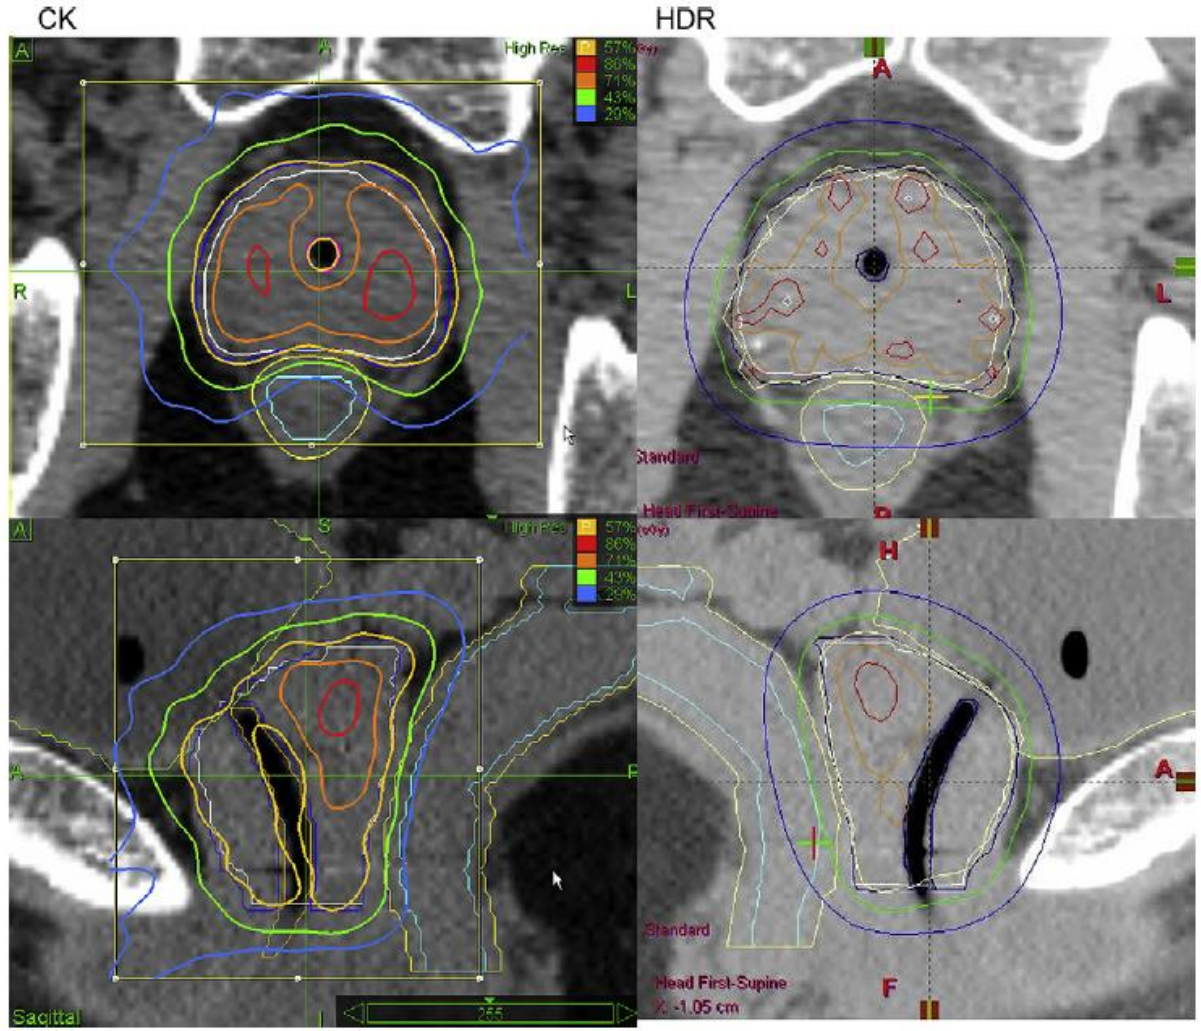

Fig. 4. Axial and sagittal comparison: CyberKnife (CK) vs. simulated high-dose-rate (HDR) dosimetry. White line = prostate contour; dark blue line = 2-mm planning target volume expansion. Isodose lines shown as follows: 150%, red; 125%, orange; 100%, yellow (very light on HDR image); 75%, green; and 50%, blue. Note similar morphologic characteristics of 100%, 125%, and 150% coverage lines, with partial exclusion of the urethra from 100% isodose volume coverage with CK (left) and lower rectal wall and mucosa 75% and 50% isodose volume with CK (left).

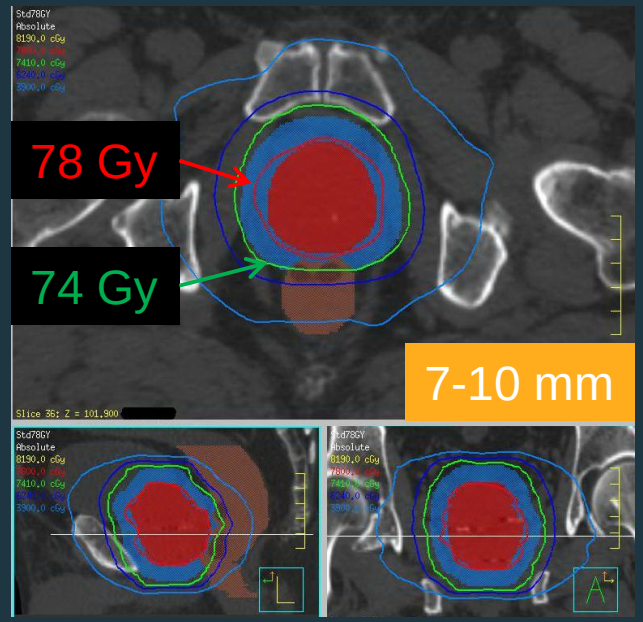
Standard EBRT vs SBRT

- 2-3 Gy / Fx
- Total Dose = 60-78 Gy
- PTV margin > 5 mm
- IGRT = optional
  - CBCT
  - Fiducial markers
  - US system
- Tx schedule = daily X 4-8 weeks
- No rectal devices

- 7-9 Gy / Fx
- Total Dose = 35-45 Gy
- PTV margin ≤ 5 mm
- IGRT = mandatory
  - Fiducial markers
  - Robotic tracking system
  - gating
- Tx schedule =1-2 /week X 2-4 weeks
- Rectal devices for high doses regimen

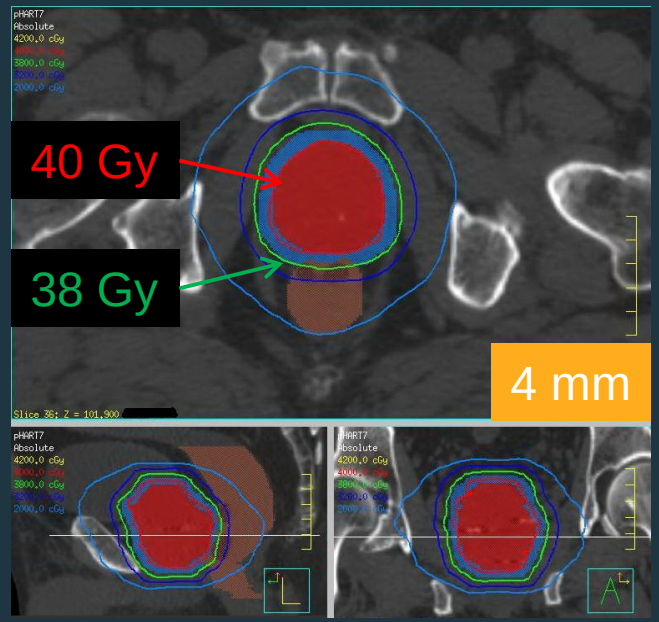
IGRT vs SABR vs 2STAR

RT Past



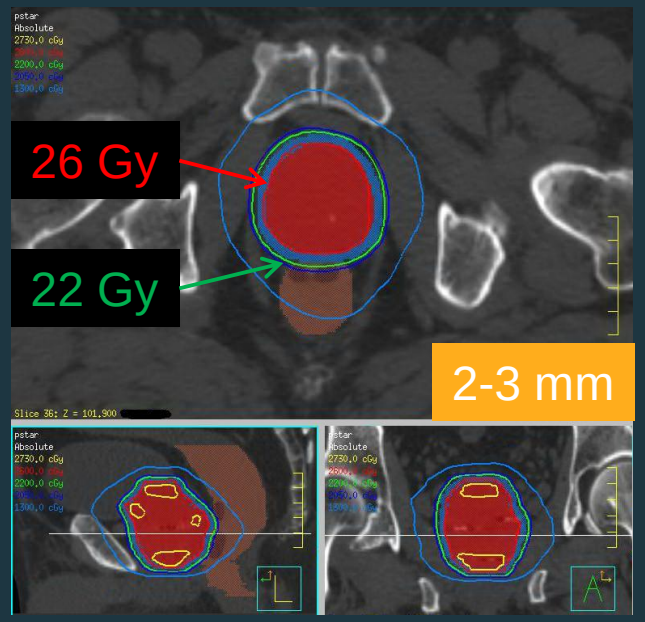
EQD2 tumor dose = 78 Gy
EQD2 rectal dose = 73 Gy
PTV-rectum overlap = 3.5cc

RT Present



EQD2 tumor dose = 110 Gy
EQD2 rectal dose = 73 Gy
PTV-rectum overlap = 1.3cc

RT Future



EQD2 tumor dose = 110 Gy
EQD2 rectal dose = 55 Gy
PTV-rectum overlap = 0.4cc

*, weighted average. SABR, stereotactic ablative body radiation; EQD2, equivalent dose in 2 Gy; GU, genitourinary; GI, gastrointestinal; ED, erectile dysfunction; NR, not reported; Med FU, median follow-up; mo, months; bDFS, biochemical disease-free survival.

SBRT vs EBRT

Ultra-hypofractionated versus conventionally fractionated radiotherapy for prostate cancer: 5-year outcomes of the HYPO-RT-PC randomised, non-inferiority, phase 3 trial

Anders Widmark, Adalsteinn Gunnlaugsson, Lars Beckman, Camilla Thellenberg-Karlsson, Morten Hoyer, Magnus Lagerlund, Jon Kindblom, Claes Ginman, Bengt Johansson, Kirsten Björnlinger, Mihajl Seke, Måns Agrup, Per Fransson, Björn Tavelin, David Norman, Björn Zackrisson, Harald Anderson, Elisabeth Kjellén, Lars Franzén, Per Nilsson

- N = 1180
- 78 Gy/39 vs 42.7 / 7
- 89% IR and 11% HR
- No difference 5y FFS
- No difference in Toxicity
  - acute and late GU /GI
  - ED

- N = 874
- 78 Gy/39 or 62/20 vs 36.2 /5
- ≥ 91 % IR
- No difference in acute RTOG GU and GI toxicity
- Too early for other endpoints

SBRT vs I125

Acute toxicity appears to be lower after SBRT compared to brachytherapy (from 10 to 40 % versus 30 to 40 %, respectively). Conversely, acute and late gastrointestinal toxicity (from 0 to 21 % and from 0 to 10 % of grade 2, respectively) appears more frequent with SBRT. Late urinary toxicity seems identical between both techniques (from 20 to 30 % of grade 2), with a possible urinary flare syndrome. Both treatments have an impact on erectile dysfunction, although it is not possible to conclude that a technique is superior because of the limited data on SBRT. SBRT has better bowel and urinary (irritation or obstruction) quality of life scores than brachytherapy; while sexual and urinary incontinence remain the same. The absence of randomized trial comparing SBRT with brachytherapy for prostate cancers does not allow to conclude on the superiority of one technique over another, thus justifying a phase III medicoeconomic evaluation.

SBRT vs EBRT vs BT

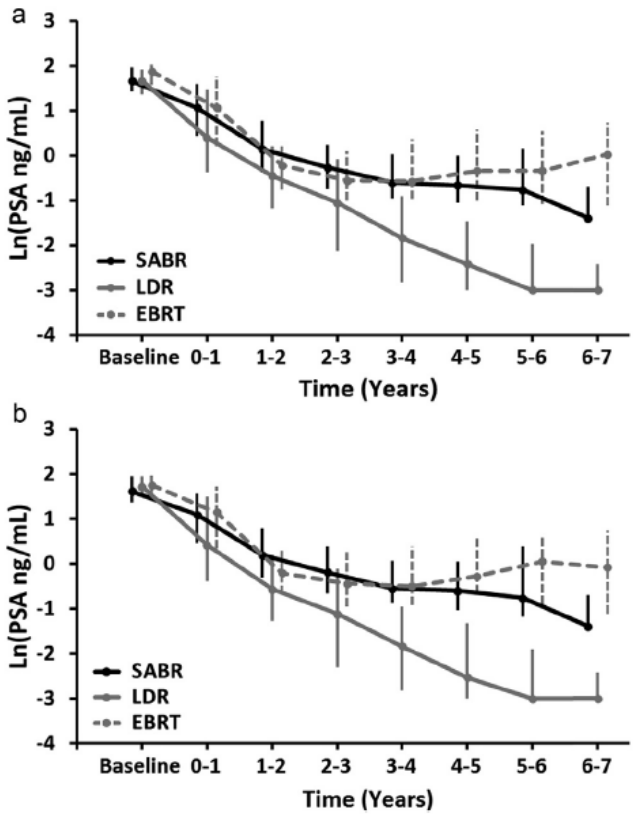

Fig 3. Semi-log plot of median prostate-specific antigen (PSA) follow-up profiles stratified by cohort (SABR, LDR, EBRT) for (a) all patients ($n = 602$) and (b) patients included in final propensity score matched cohorts only ($n = 324$). Mean ± mean 95% confidence intervals shown. SABR, stereotactic ablative radiotherapy; LDR, low dose rate brachytherapy; EBRT, external beam radiotherapy.

A. Loblaw et al. / Clinical Oncology 29 (2017) 161–170

Dirty Little Secret

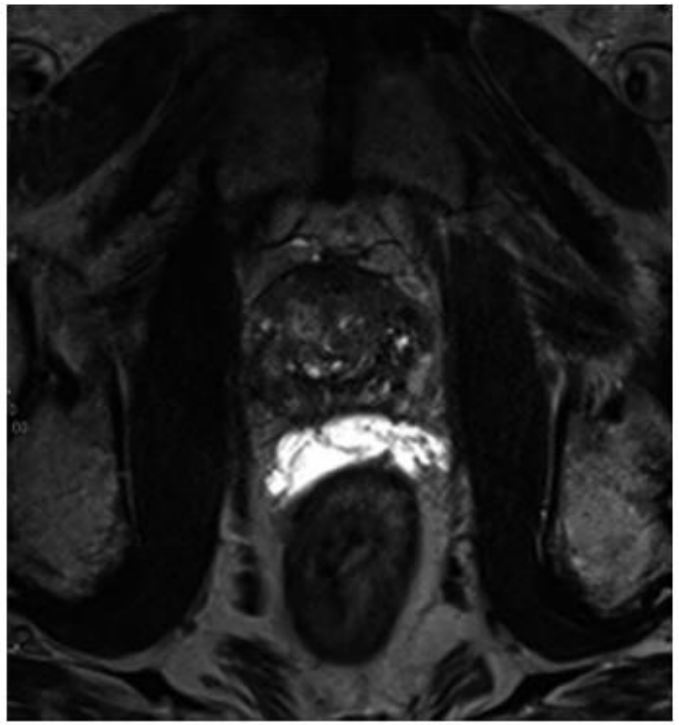

Figure 1. MRI image of SpaceOAR in situ. SpaceOAR appears bright on a T2-weighted sequence. Note the separation between the posterior prostate and anterior rectal wall.

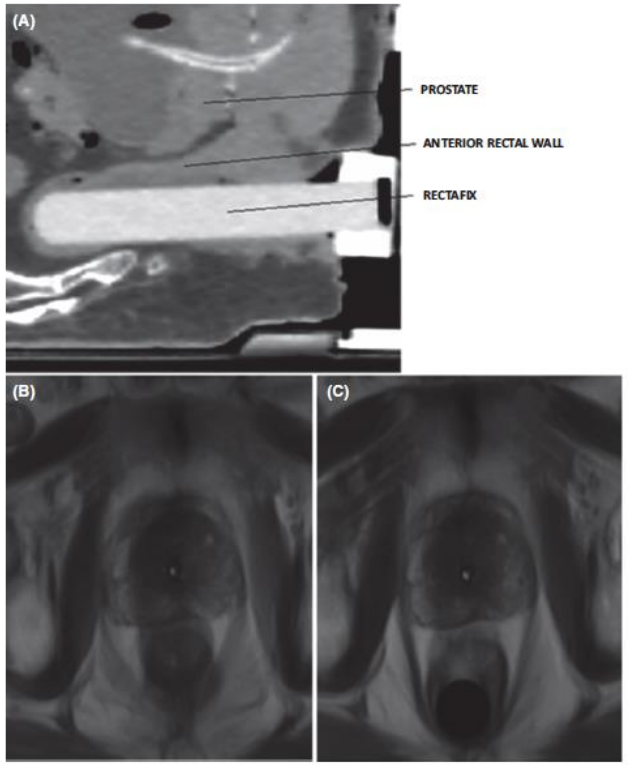

Figure 2. (A) Sagittal CT image of Rectafix RDD in situ with relevant structures identified, (B) MRI images of patient without Rectafix in situ and (C) with Rectafix in situ. Note the posterior displacement of the rectum.

Evidence based data in favor of BT

HDR monotherapy

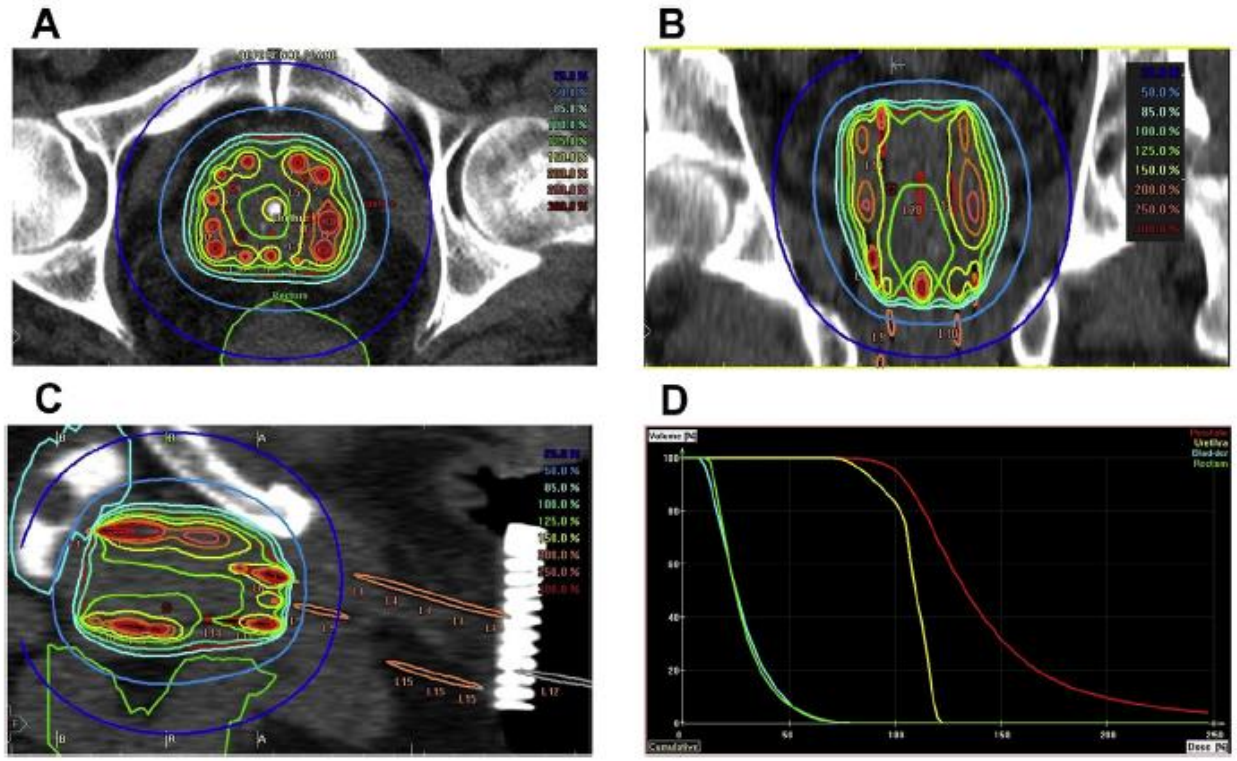

Fig 2. Results of inverse optimisation with Oncentra Prostate (Elekta-Brachytherapy, Elekta AB, Sweden) using hybrid inverse planning optimisation for a computed tomography-based treatment plan of high dose rate prostate brachytherapy. The isodose lines overlay to (a) the central axial plane (reference plane), (b) a coronal plane and (c) a representative sagittal plane. (d) shows the corresponding dose volume histogram curves for the planning target volume, urethra and rectum. One hundred per cent corresponds to the aimed dose prescription.

Table 2 Dose fractionation, late genito-urinary (GU) and Gastrointestinal (GI) toxicity, and biochemical disease-free survival (DFS) by risk groupings in HDR monotherapy series.

Author	N	Dose (Gy)/no. of fractions	Median FU (yrs)	Late Grade 3 toxicity (%)		Biochemical DFS (%)

FU, follow-up; HDR, high dose-rate.

The future ?

- Phase III study comparing 36 or 25 Gy in 5 over 1-2 weeks vs Conventional / Moderate HypoFx regimen
  - PACE
  - HEAT
  - NRG GU005
- Phase III study comparing 36 or 25 Gy in 5 over 1-2 weks vs BT
  - None so far
  - Pilot study CHU de Quebec ACURA grant 2019

The future ?

- Better Patients Selection:
  - With biomarkers of tumor response and toxicity
  - Better staging M1 vs N1 vs Localized with Functional Imaging
- Better insertion / position of seeds / catheters
  - Image guided robotic BT
- Focal Therapy
- Local delivery of drugs/ radiosensitizer
- Immunotherapy and HypoFx

Conclusion

- SBRT appears equivalent to EBRT in LR, IR
- No comparative phase III study SBRT vs BT
- BT(LDR/HDR) >>> EBRT in IR, HR (phase III data)
- SBRT appears to present greater GI toxicity than BT
- SBRT lower GU toxicity than I125
- HDR lower GU/GI toxicity than I125
- The goal of SBRT is to replicate the dose distribution of HDR

Why the Substitute ?
